

Cloud Applications Secured

New realities of cybersecurity

- Attacks have become professional
- All servers “on a wire” are compromised or a target to be by hackers, criminals or foreign governments
- Regulatory requirements and reporting demands are increasing (HIPAA, PCI, NIST Cybersecurity, EU Data Privacy, etc.)

Each hack proves the need for preventive security

- FBI Director James Comey: "There are two kinds of big companies in the United States. There are **those who've been hacked by the Chinese** and **those who don't know they've been hacked by the Chinese**."
- ITRC: **621** data breaches, exposing over **77,890,487** records in 2014

The Problem - Sony Case-Study

The Solution - VNS3 Application Segmentation

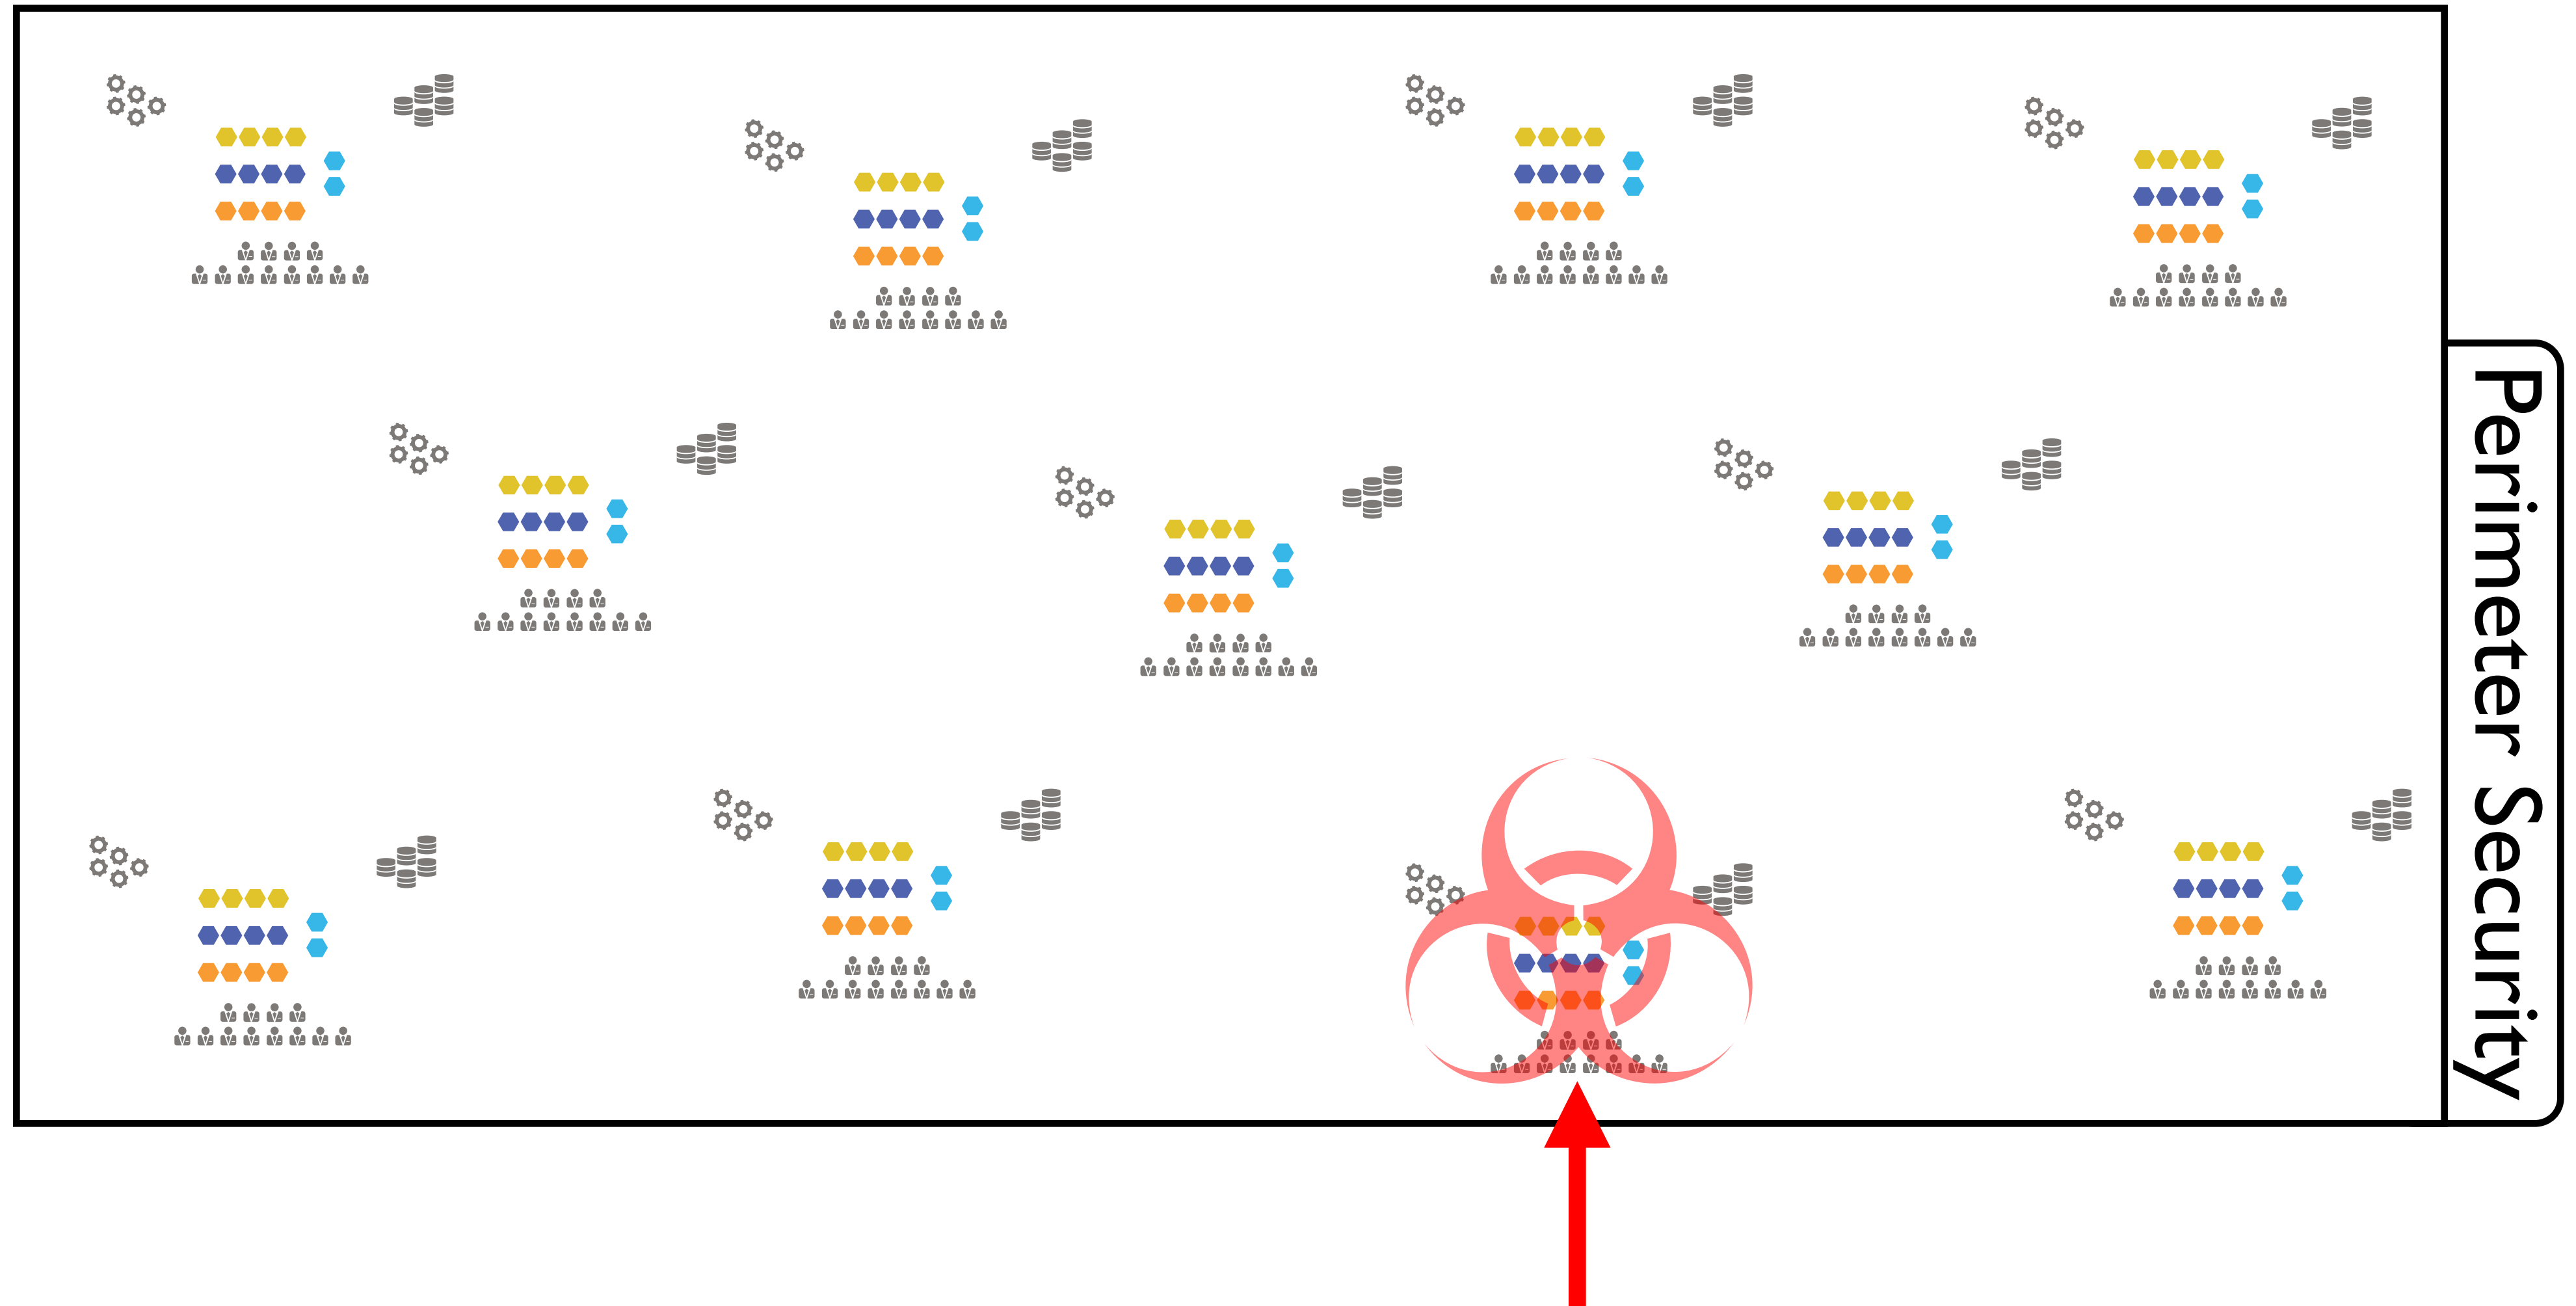

A typical business application

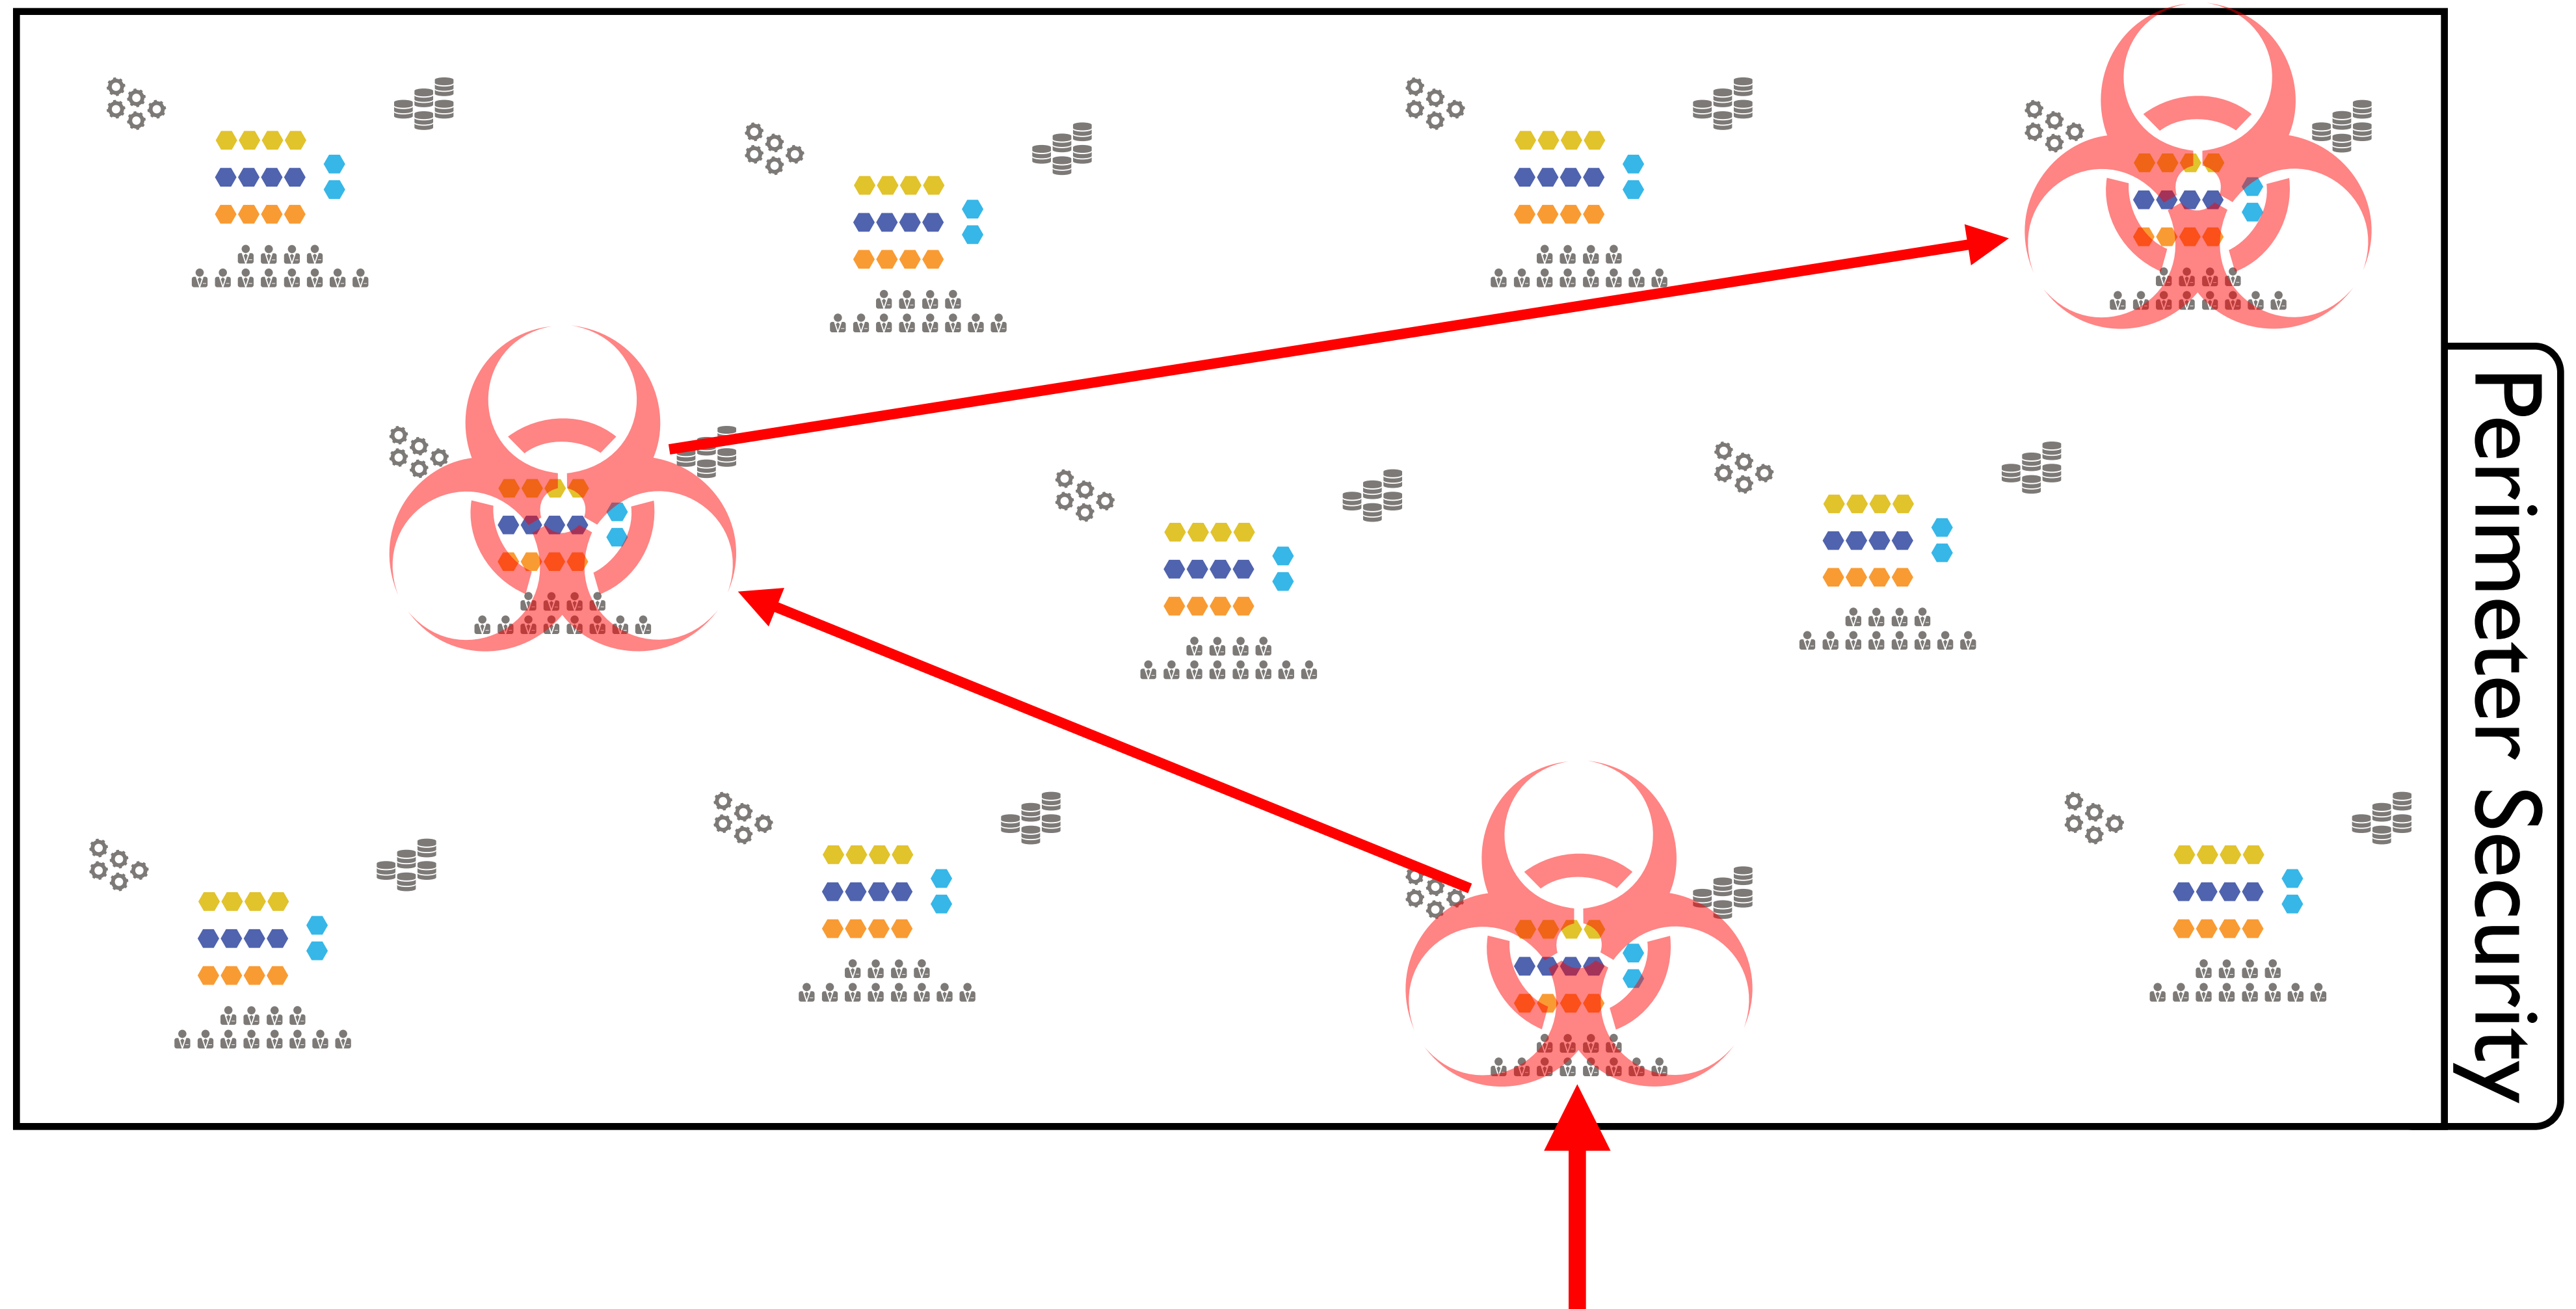

Enterprise data centres are filled with these applications,
many of them critical to the business

Hard on the outside, soft on the inside

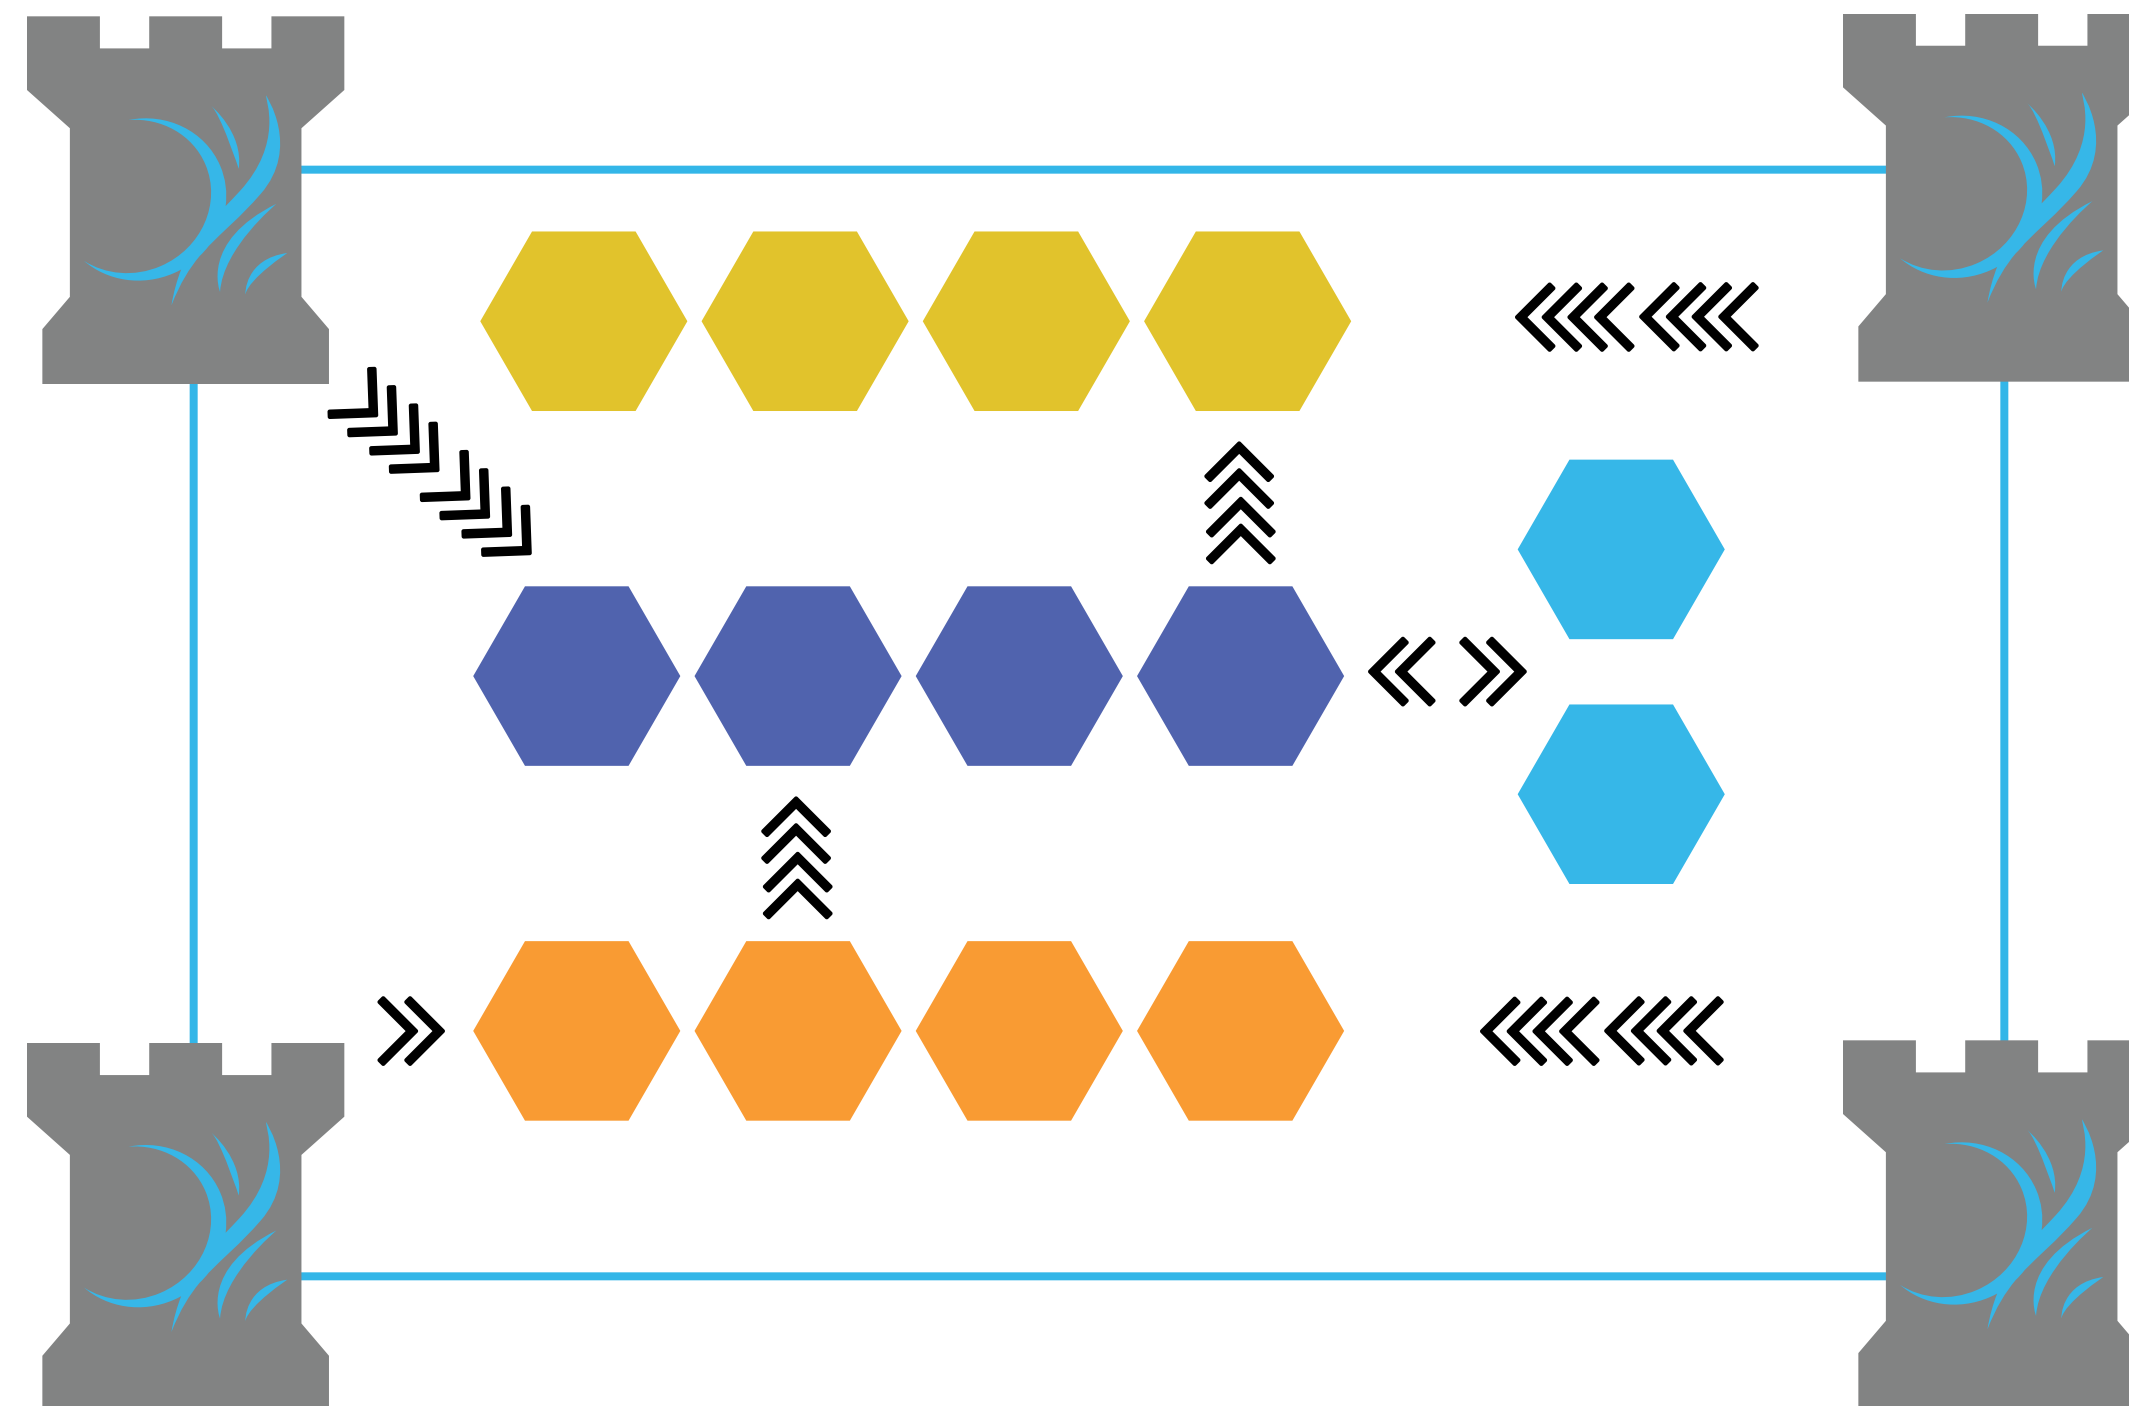

One penetration creates significant potential
for “East-West” expansion of the attack

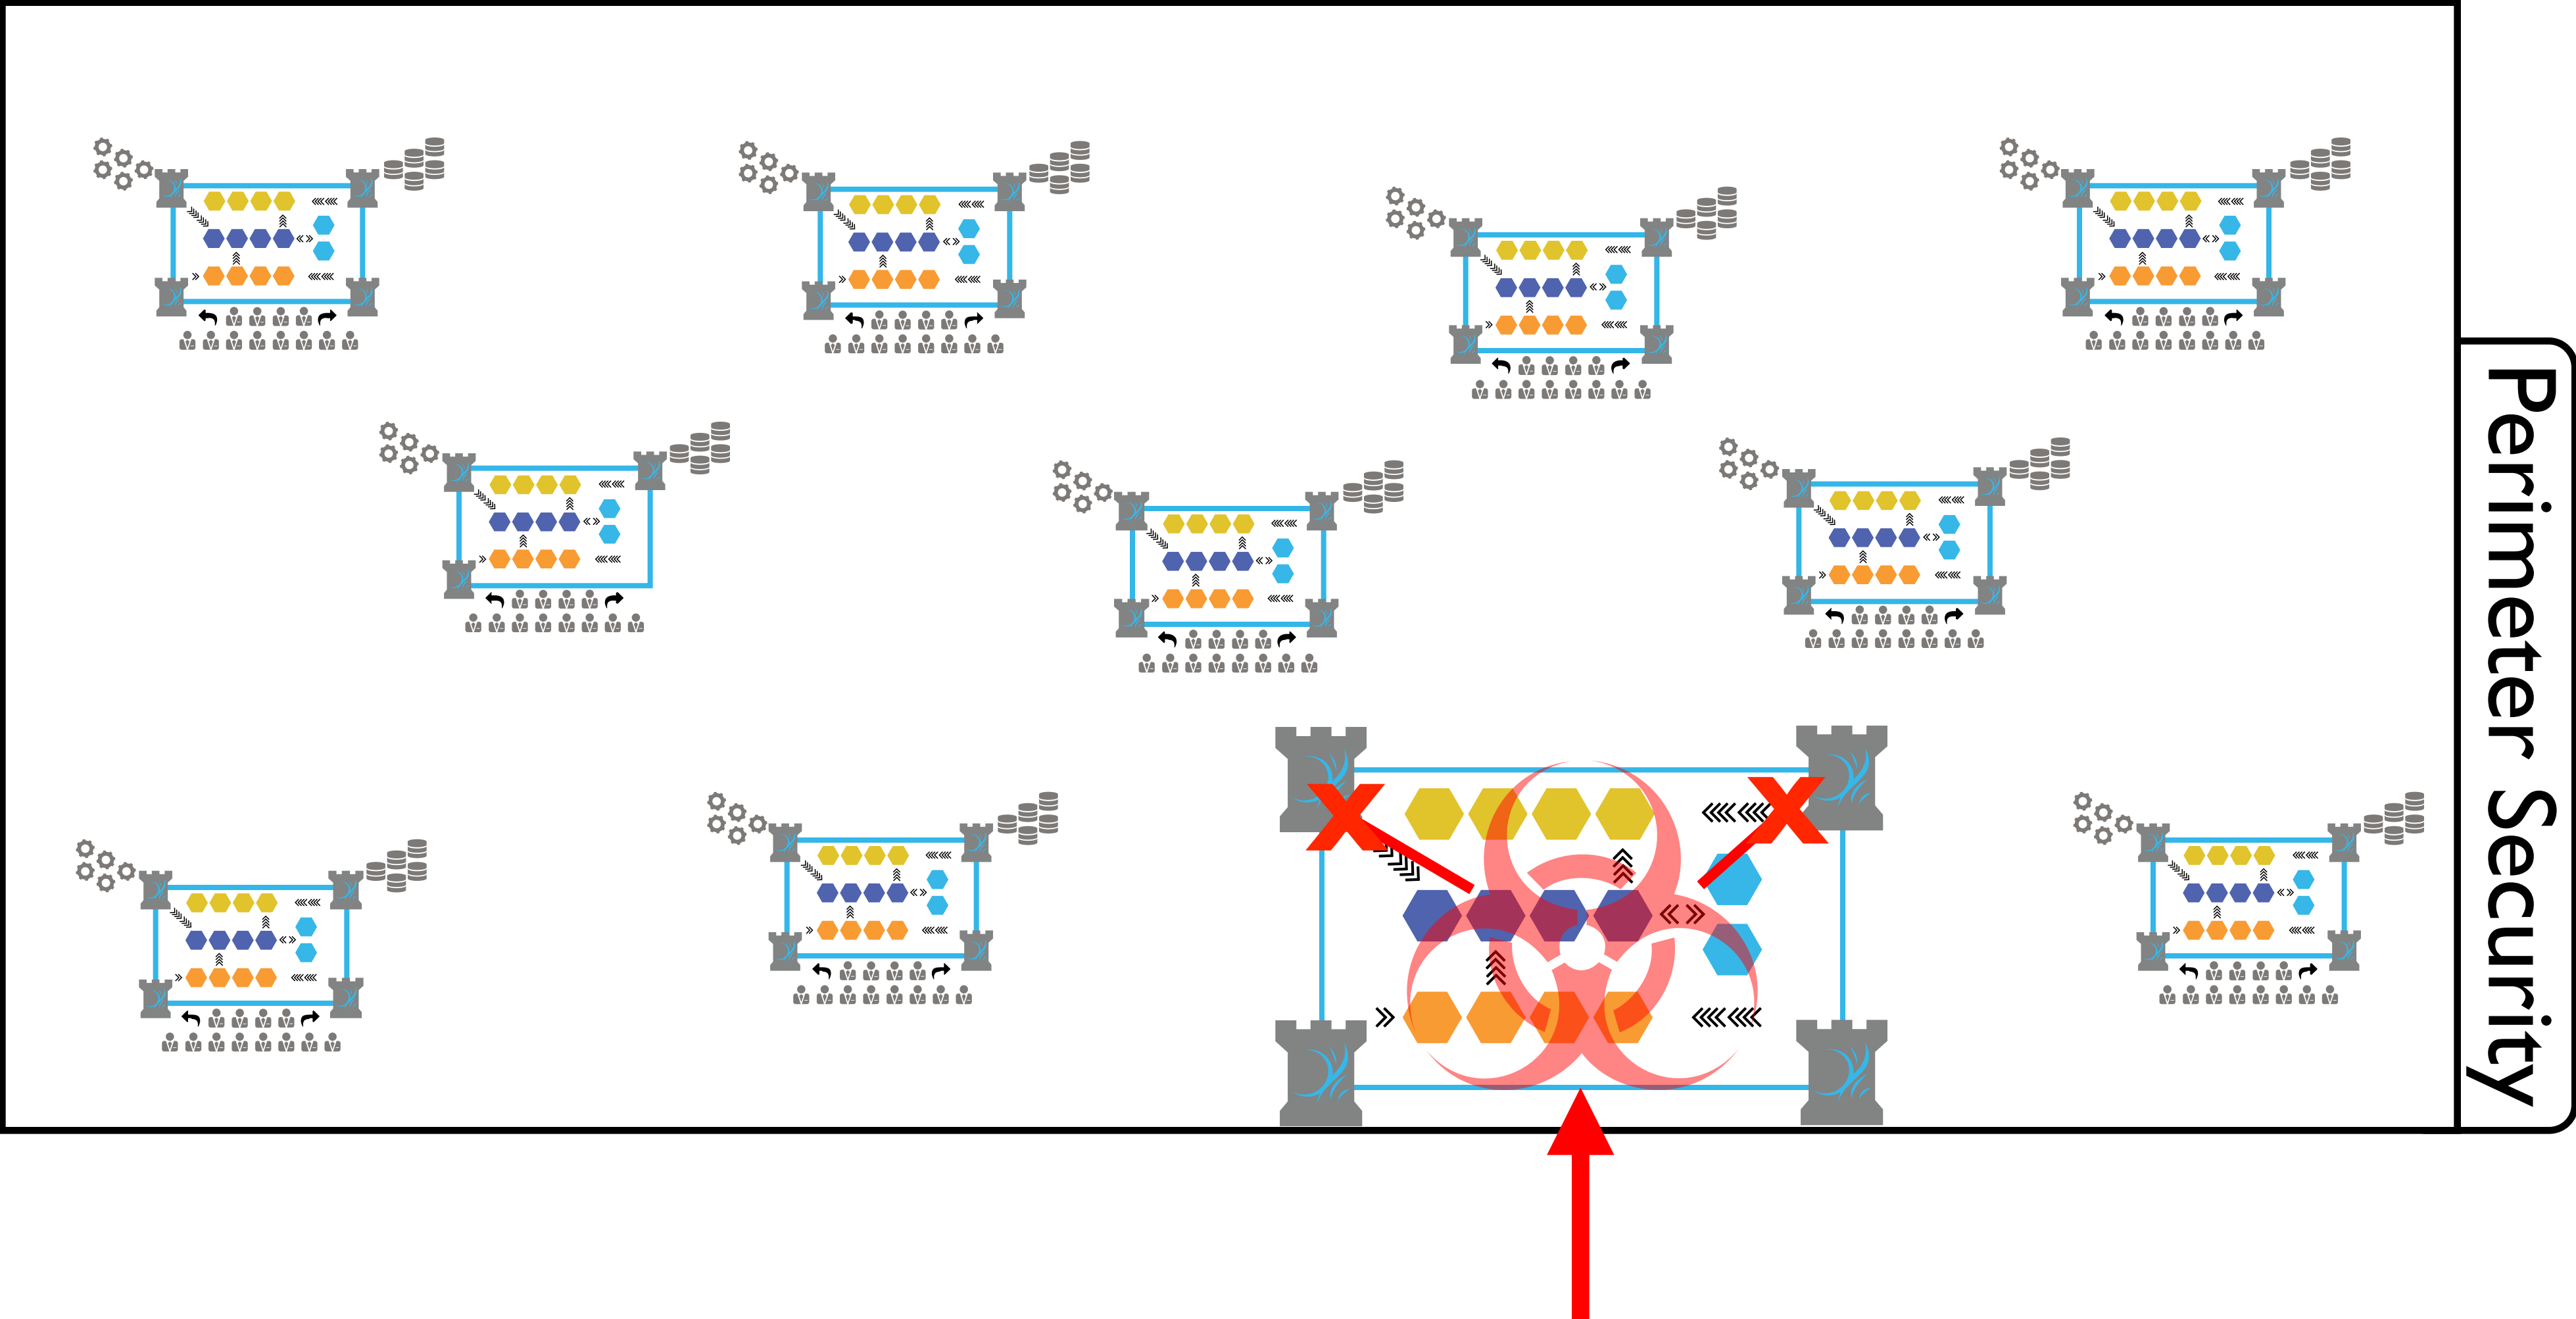

The Problem - Sony Case-Study

The Solution - An Application Security Controller

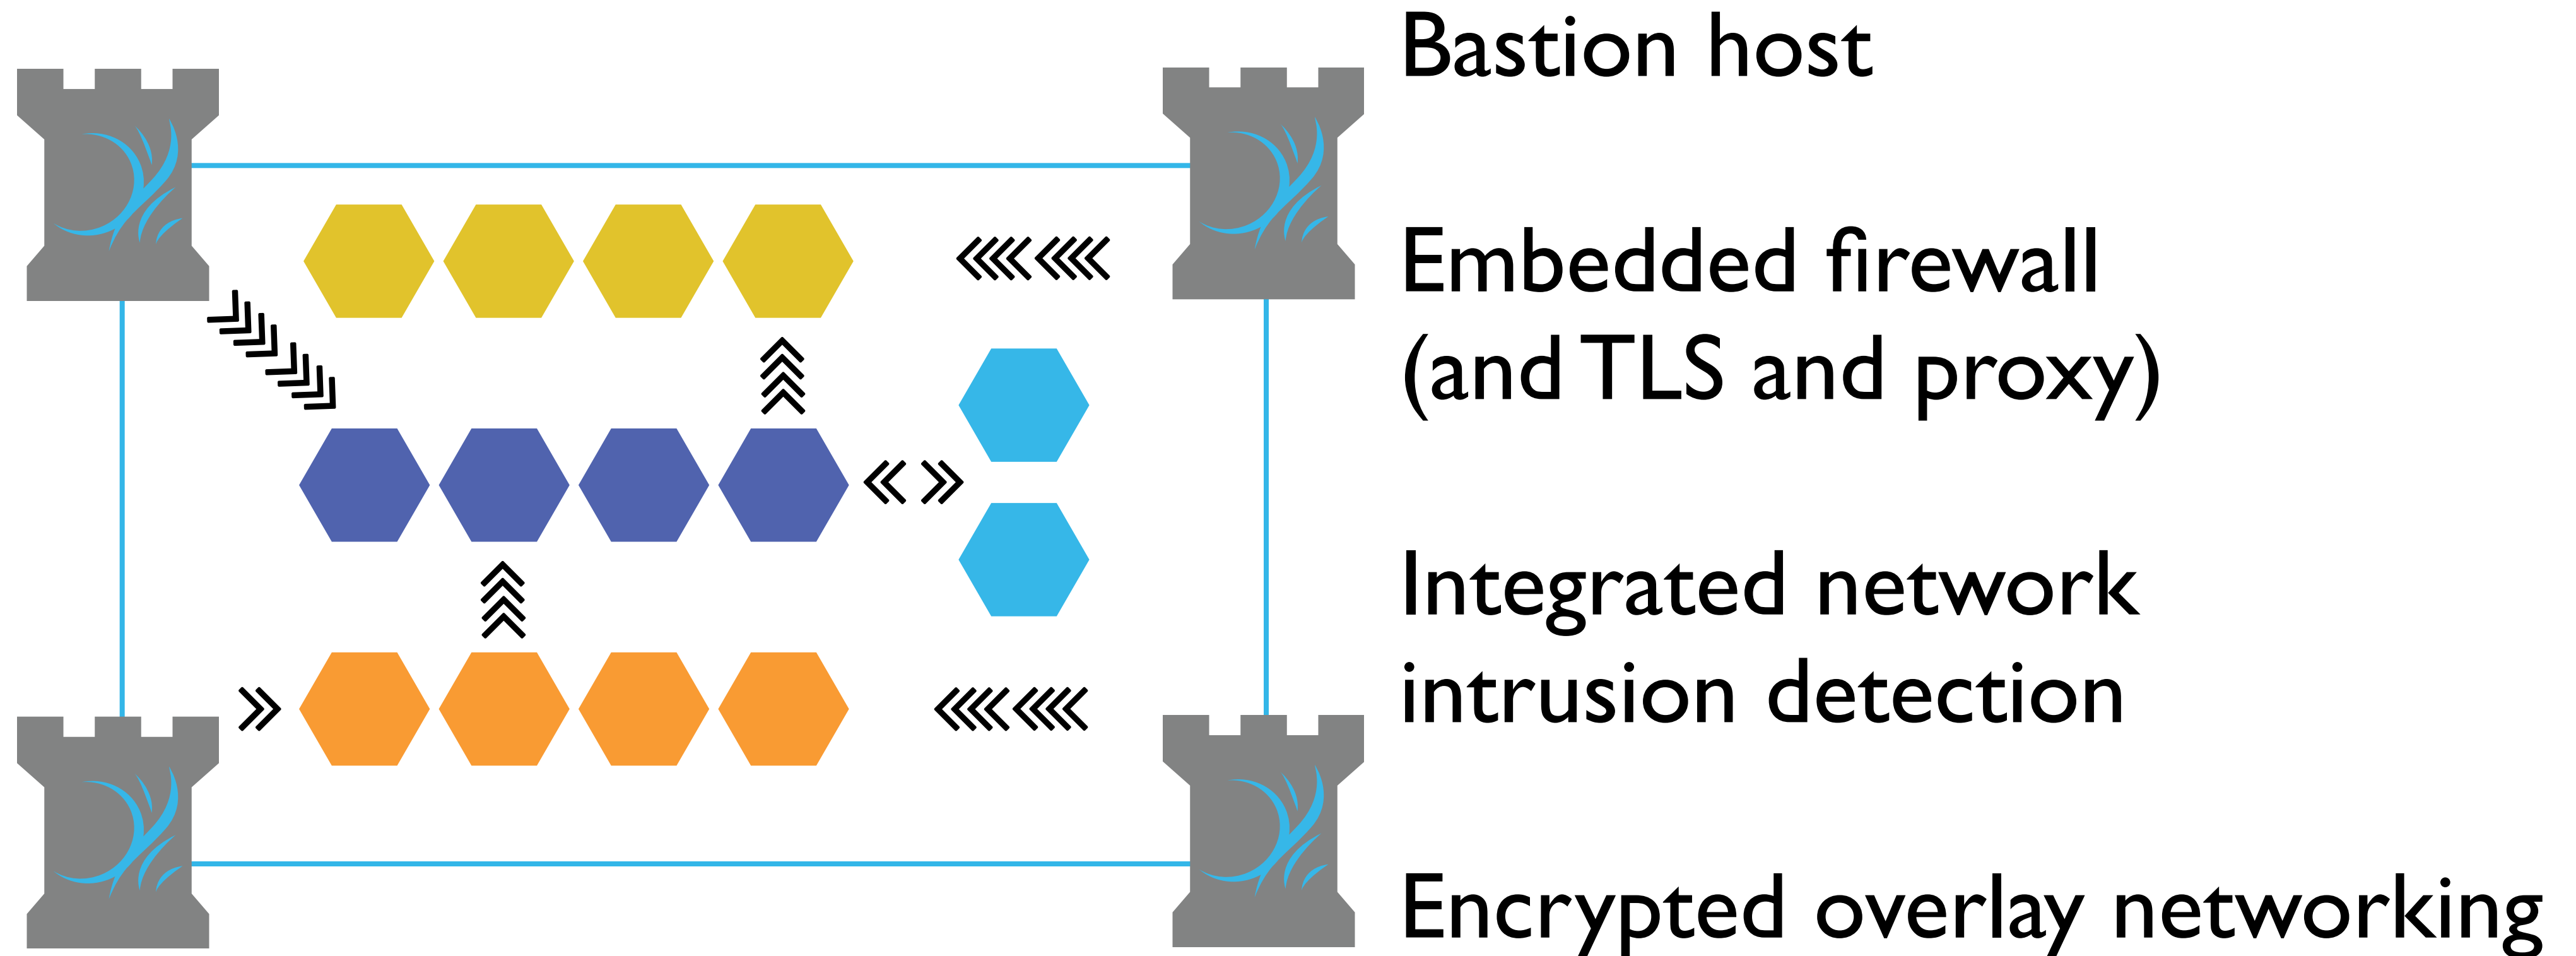

Create a micro-perimeter around critical applications in any data centre, cloud or virtualised environment

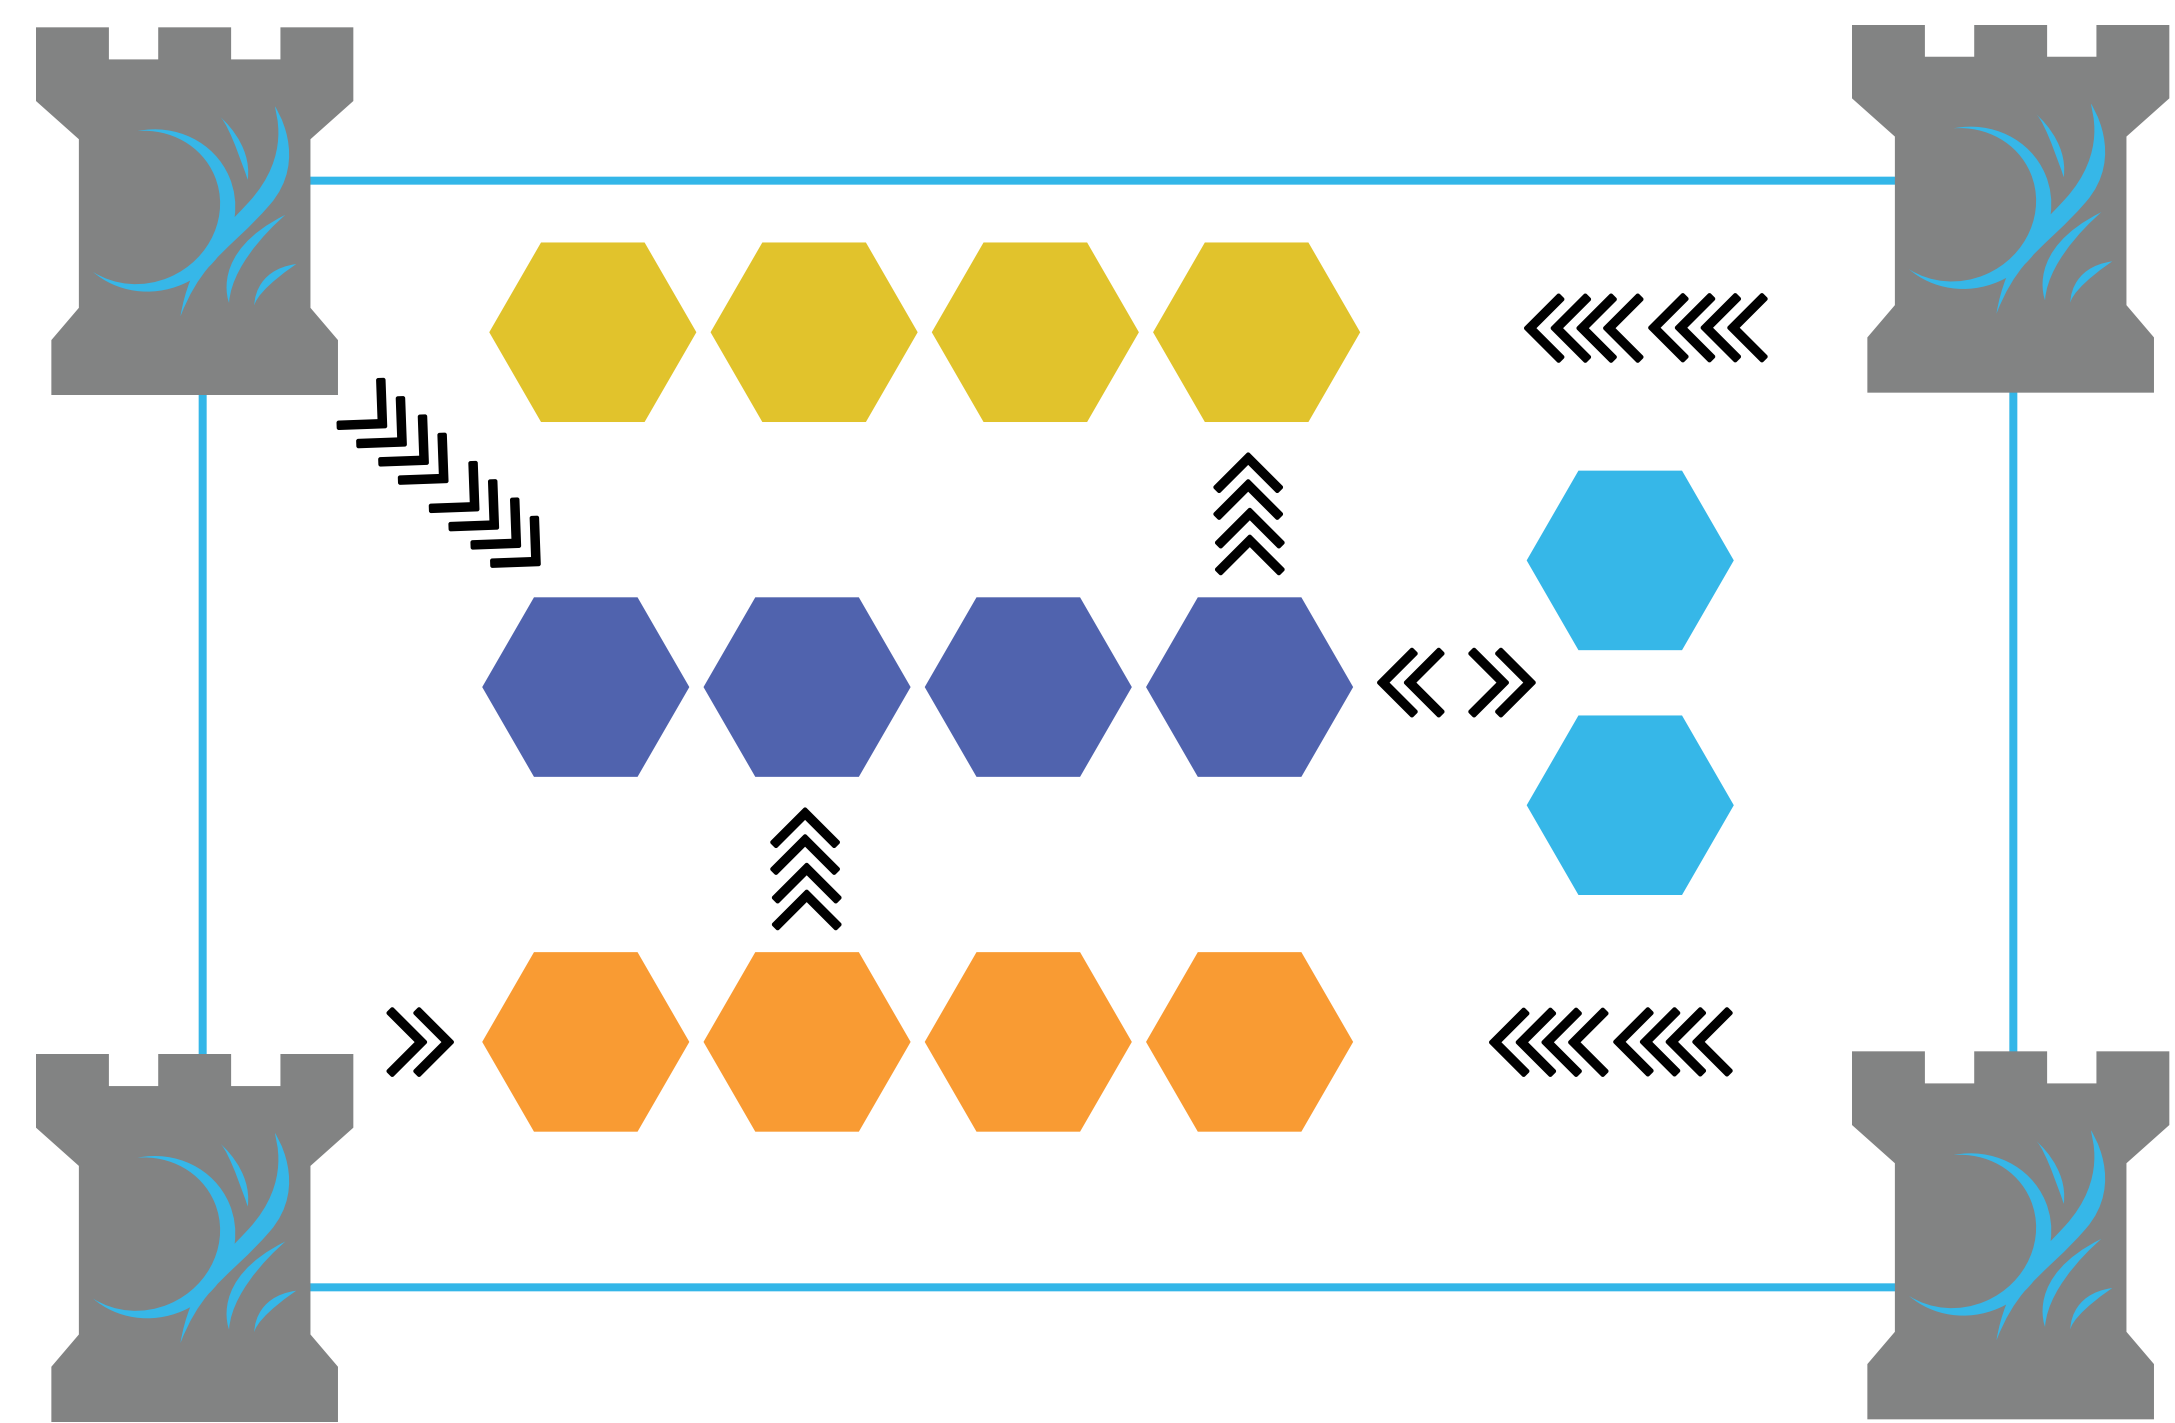

Even if there is an initial penetration event, East-West access is dramatically reduced and the attempts are easier to recognise and isolate

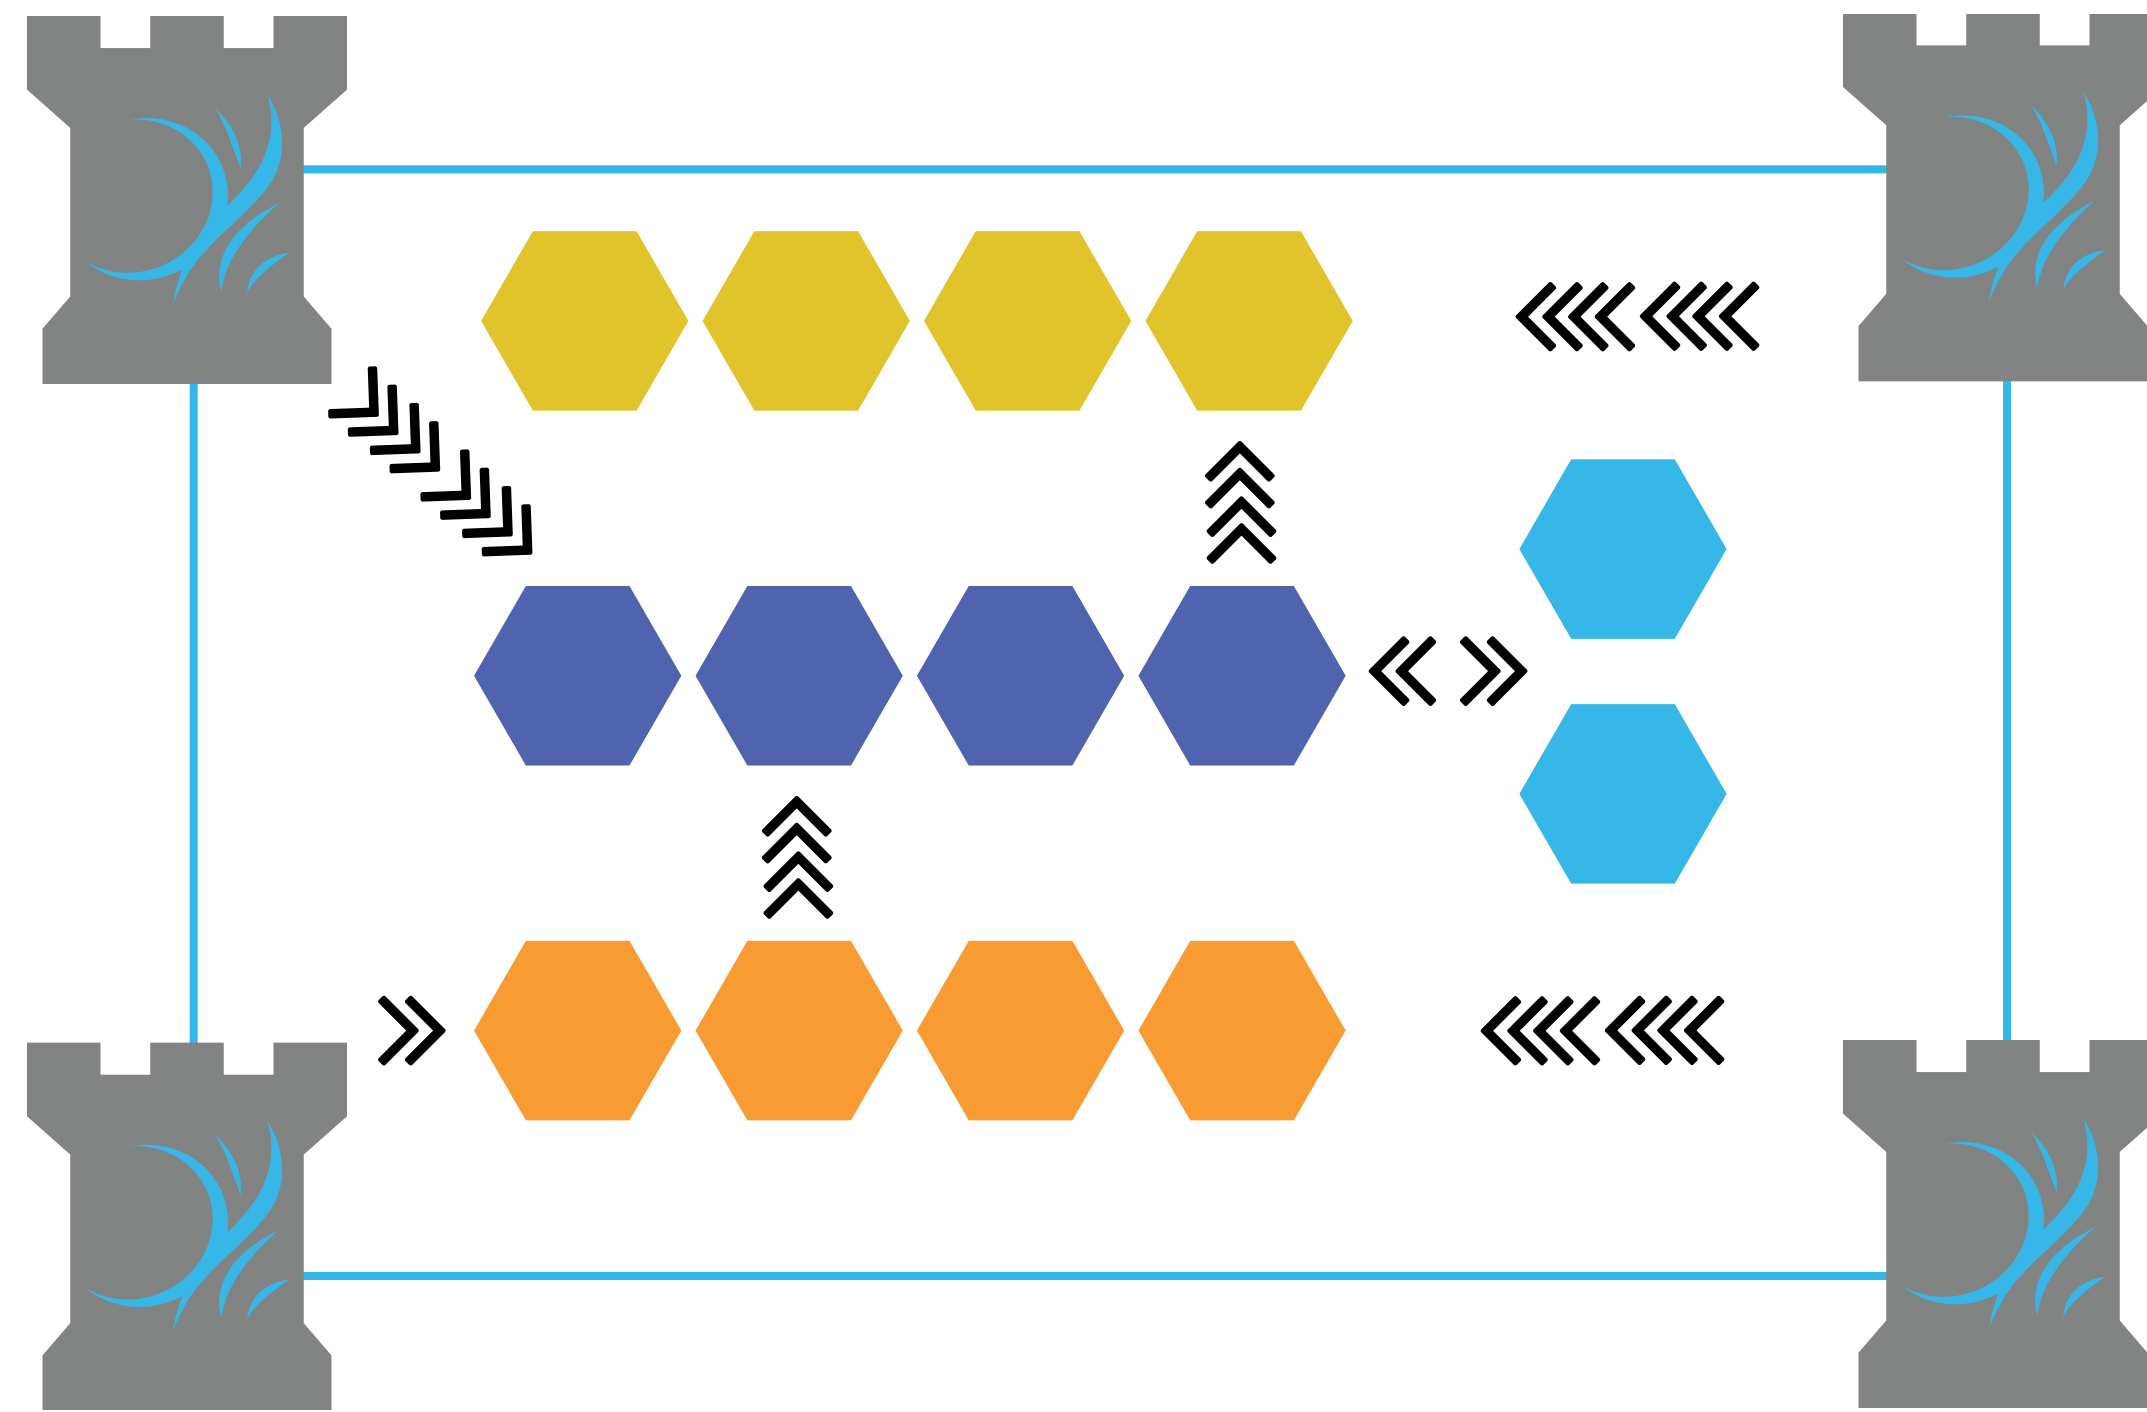

What makes an application perimeter?

Brings the cloud model home to the Enterprise

Why now - demand

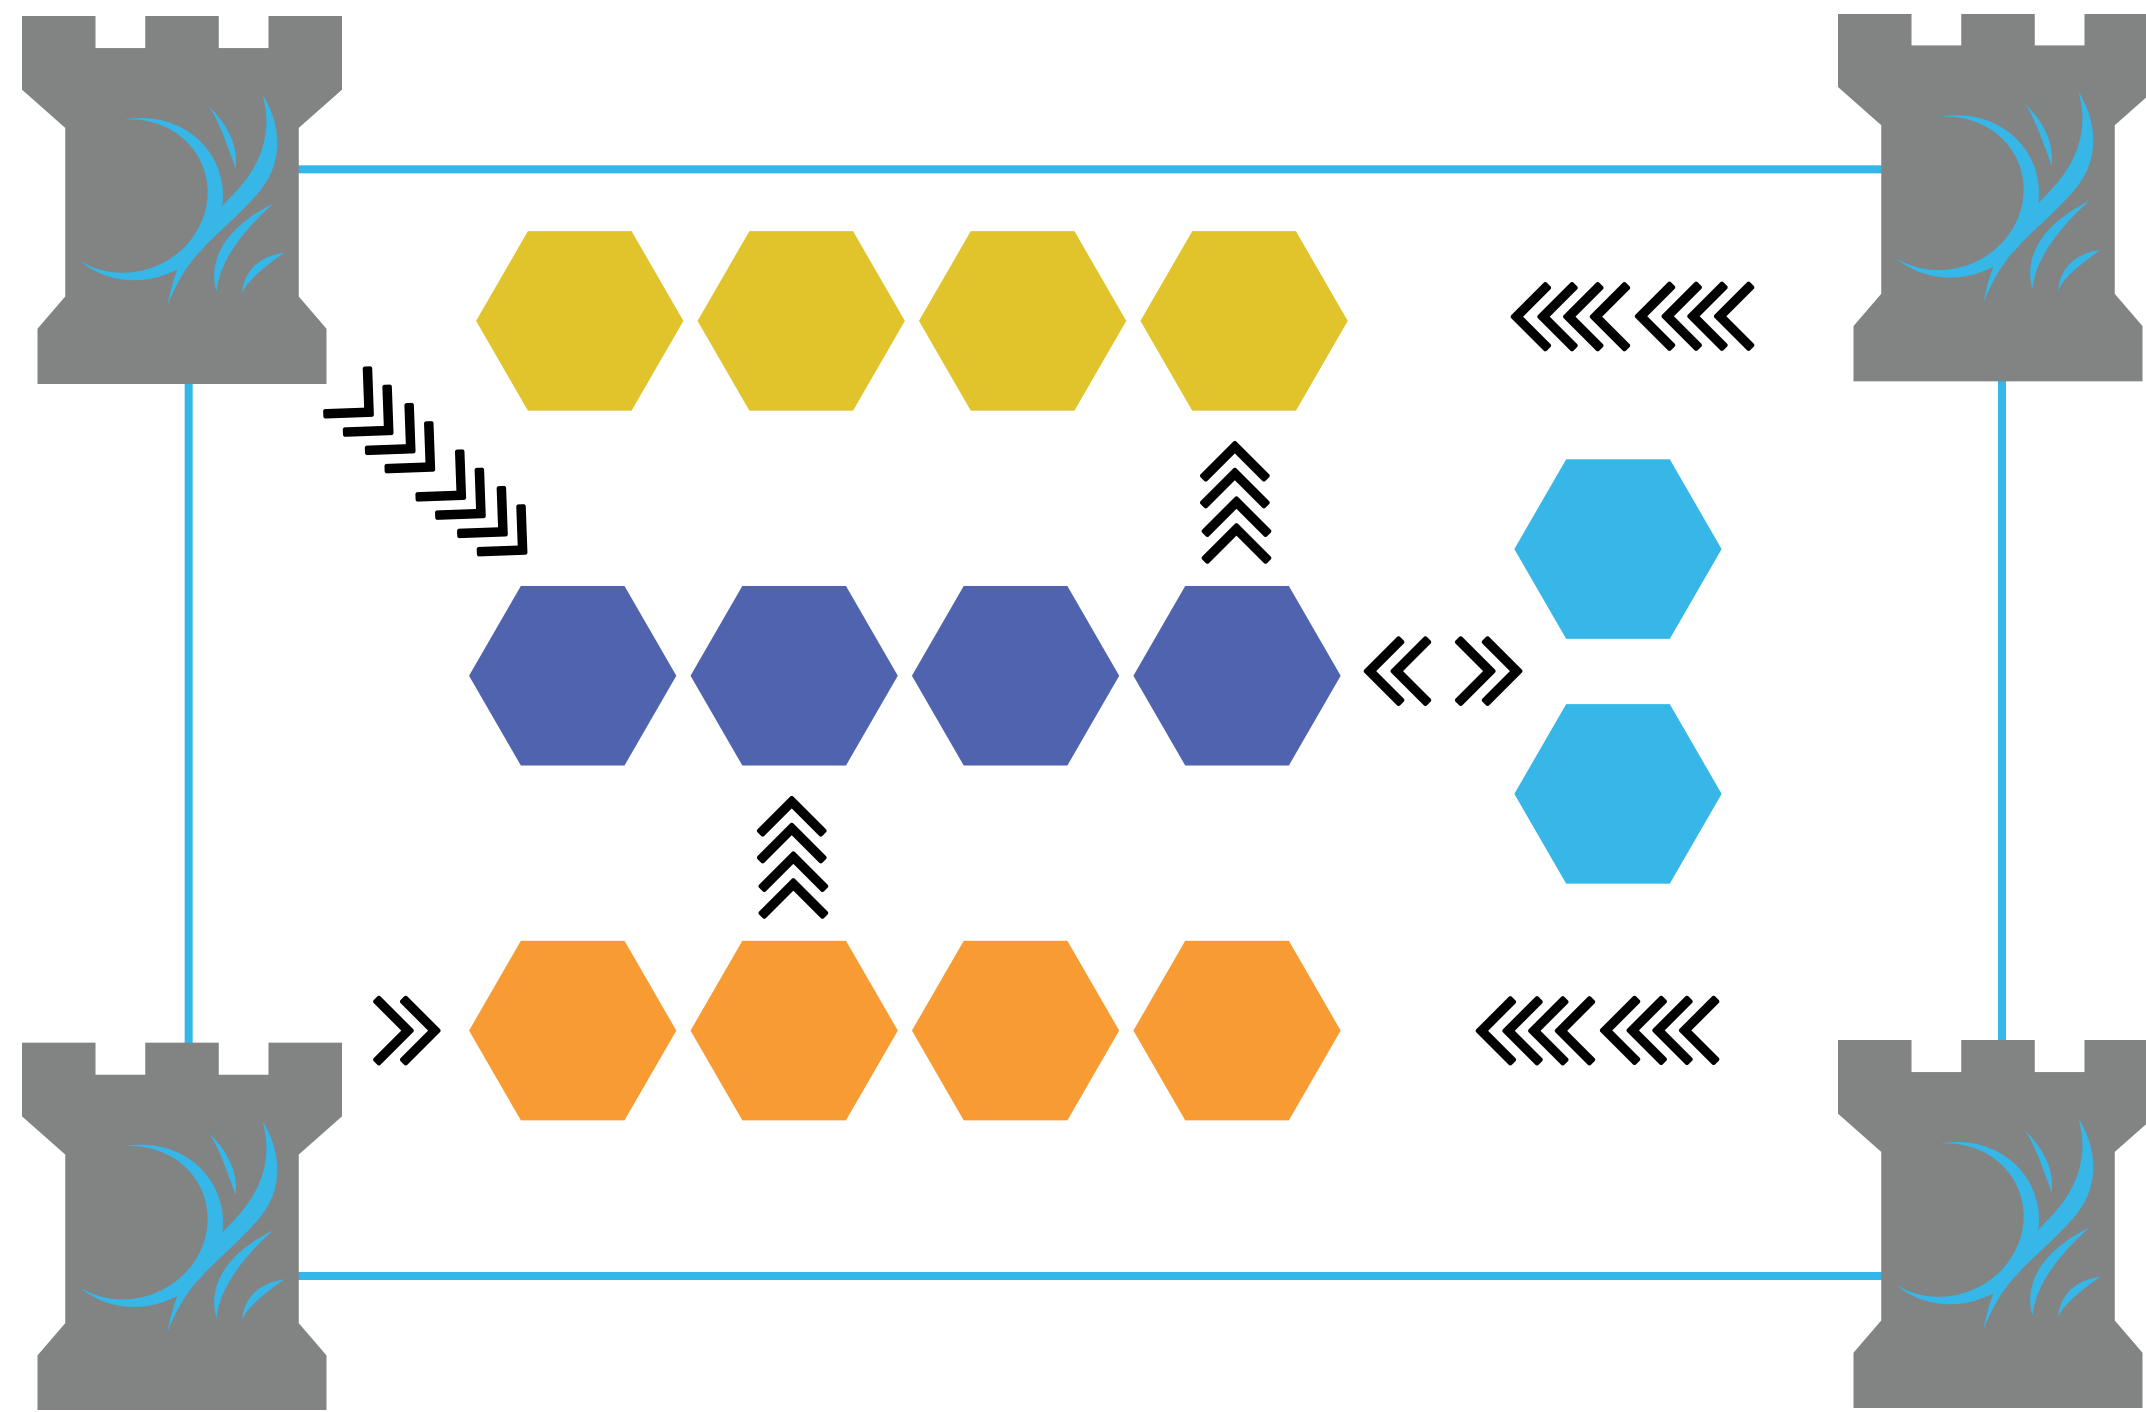

NIST Cyber Security Framework

PR.AC-5

*Network integrity is protected,
incorporating network segregation
where appropriate*

Why now - supply

Network Function Virtualisation
- we can make networks out of virtual machines and containers

Software Defined Networking
- we can manage networks through APIs

VNS3 product family

	scalable VPN	end-to-end encryption	multi-cloud, multi-region	monitor & manage	automatic failover	secure app isolation
VNS3:turret Application Security Controller	✓	✓	✓	✓	✓	✓
VNS3:net security and connectivity networking	✓	✓	✓	+	+	
VNS3:vpn free, self-service cloud connectivity	✓	✓				
ADD-ONS						
+ VNS3:ms virtual network management system						
+ VNS3:ha high availability & automatic failover						

Summary

- Applications accessible via the Internet (public or private cloud) are targets.
- One compromise becomes the starting point for East-West attacks across an Intranet.
- Application Security Controllers use NFV and SDN to build an application centric perimeter within the established Enterprise perimeter.
- Brings the public cloud model home to the Enterprise.

Anywhere an application can go - it needs
security & connectivity.

Cohesive Networks - cloud security made easy

 VNS3 family of **security and connectivity solutions** protects cloud-based applications from exploitation by hackers, criminal gangs, and foreign governments

 1000+ customers in 20+ countries across all industry verticals and sectors
