Consumers Want Privacy & Superior Experiences

Why do I have to keep entering the same data again and again?

Where's my password?

Why does everyone have my data?

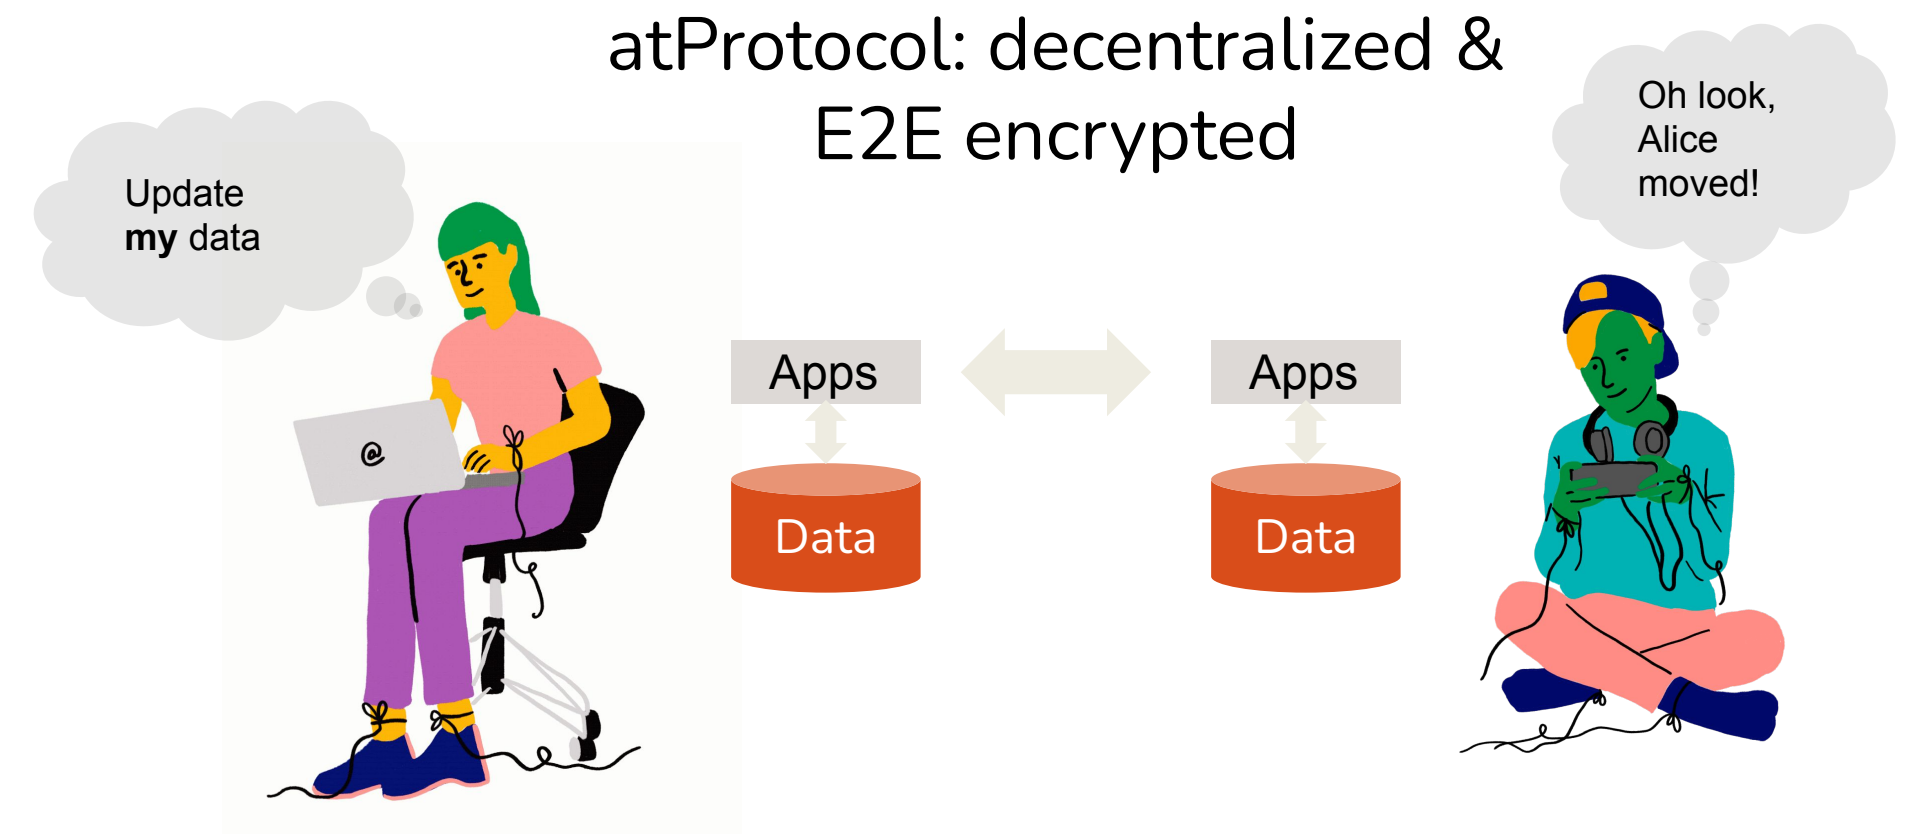

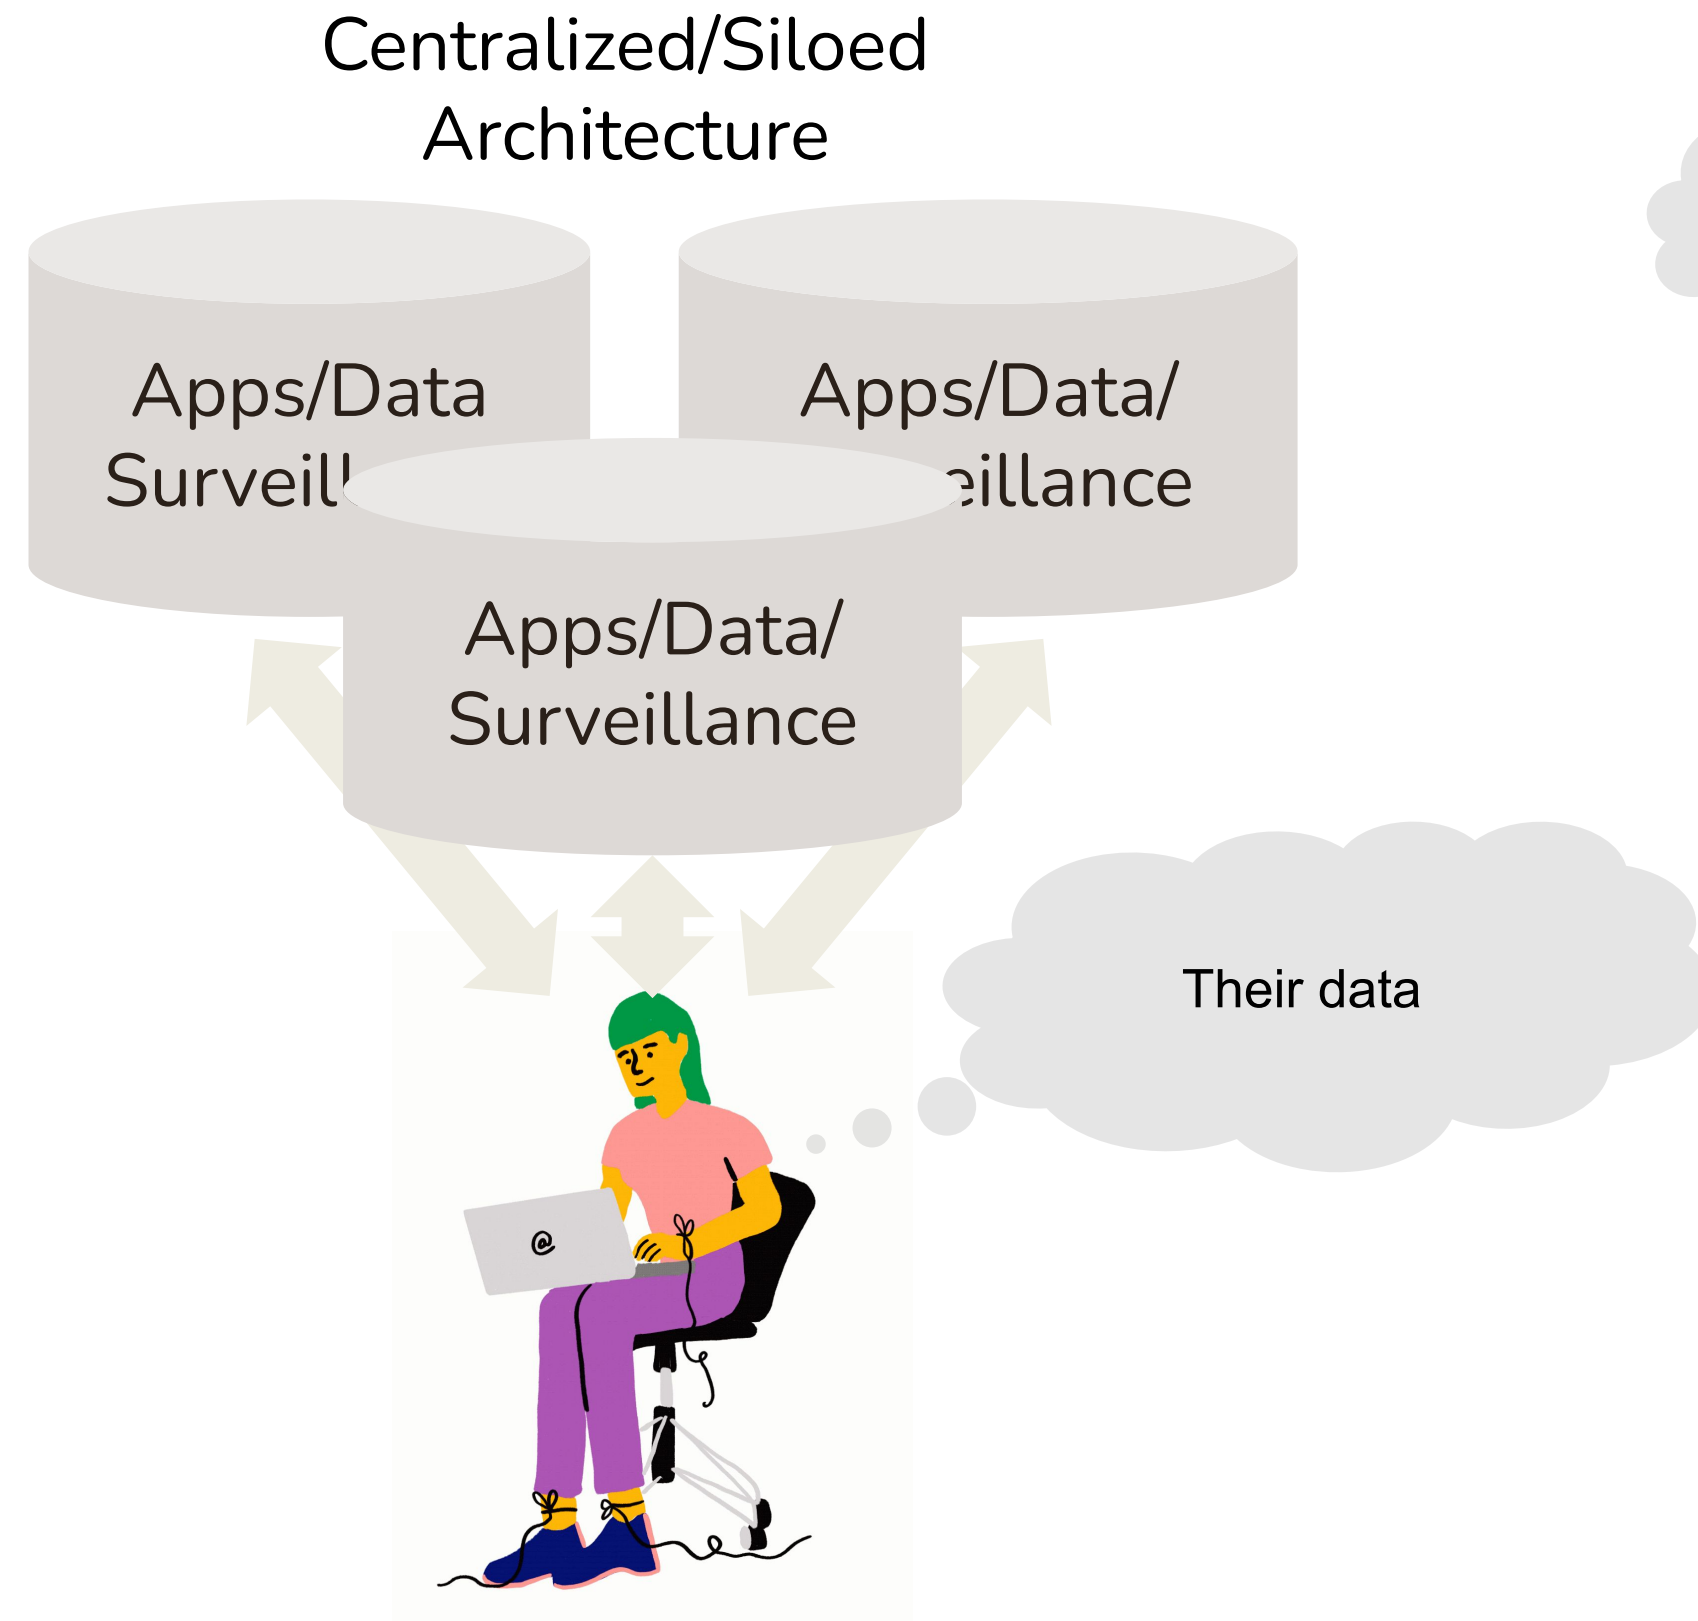

How do I control this?

Why am I being followed?

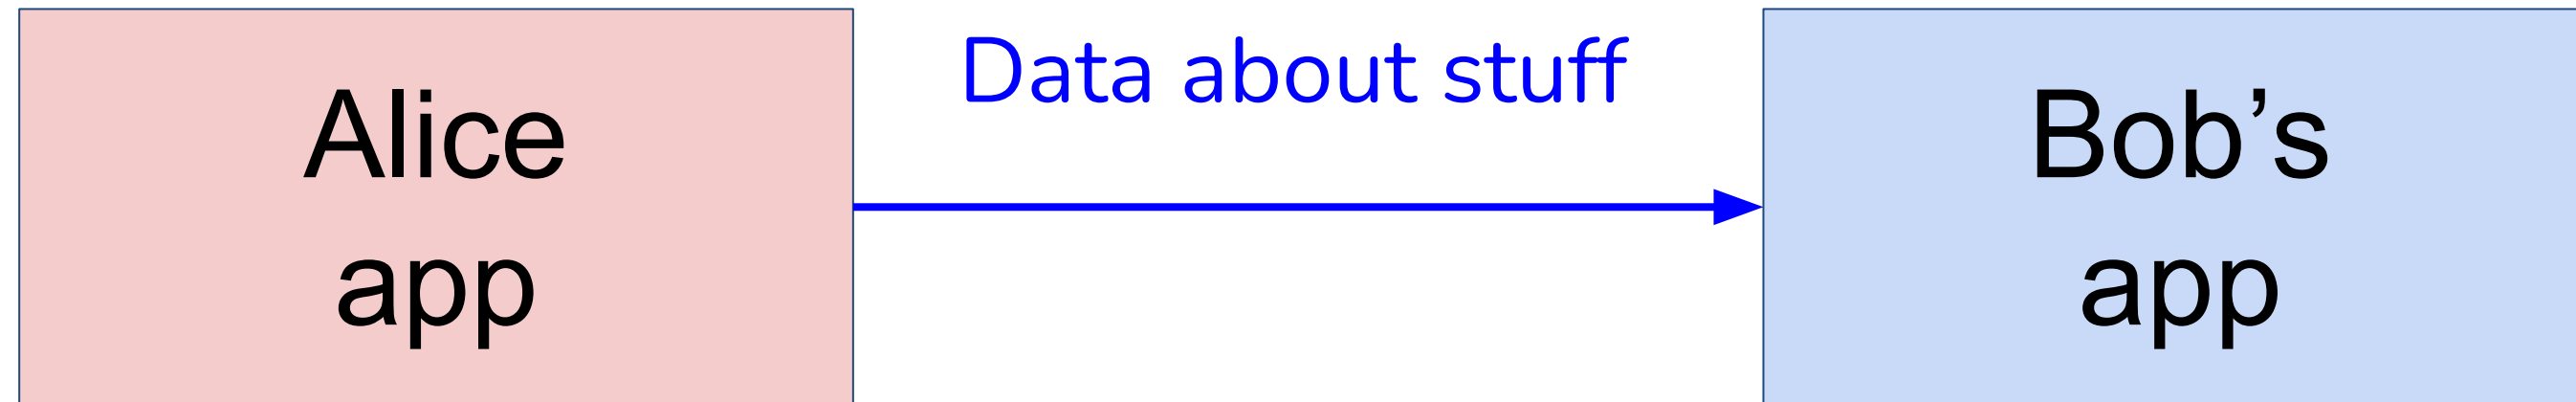

How did they know I went there?

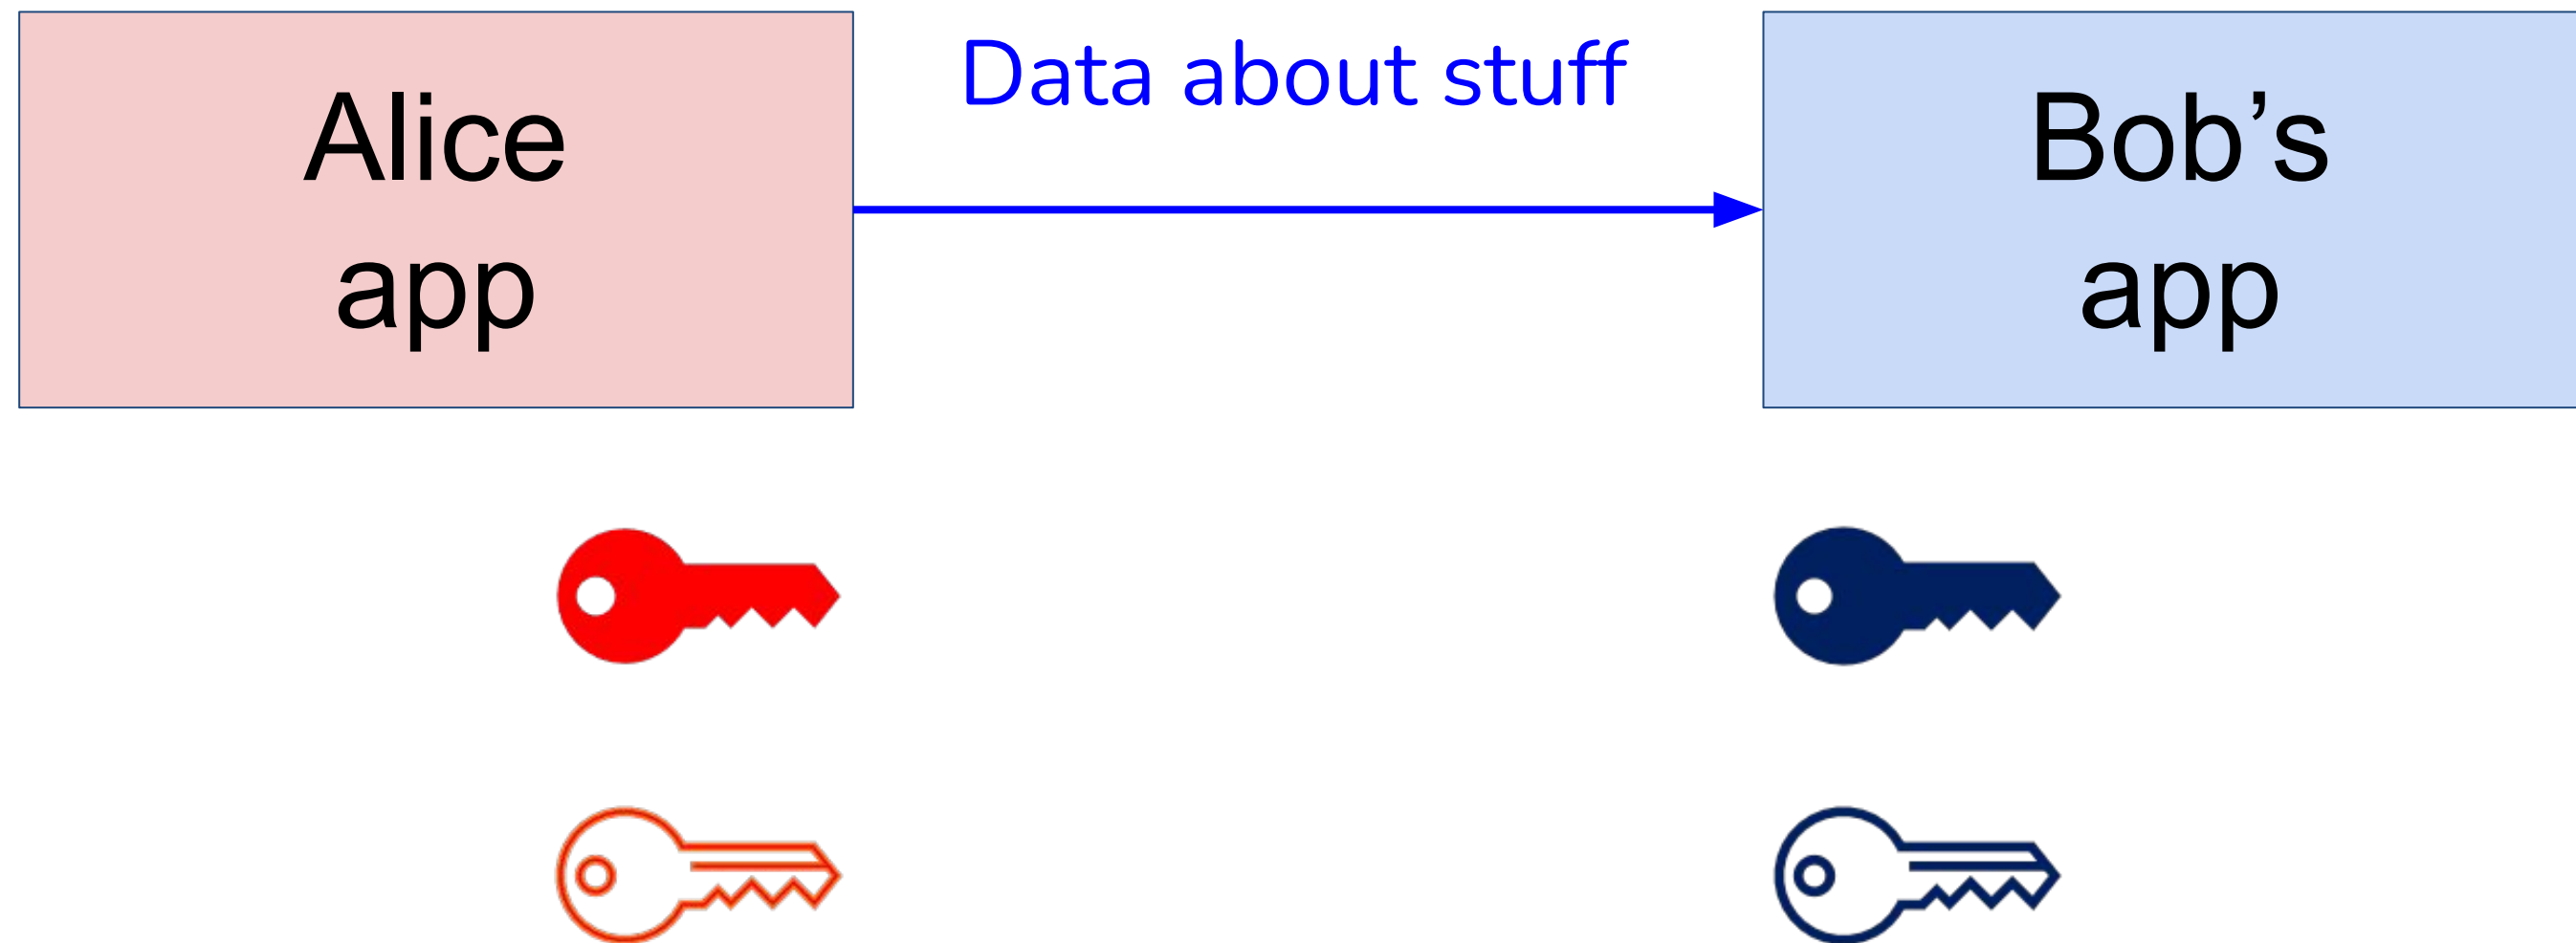

Framework for E2E encrypted Apps

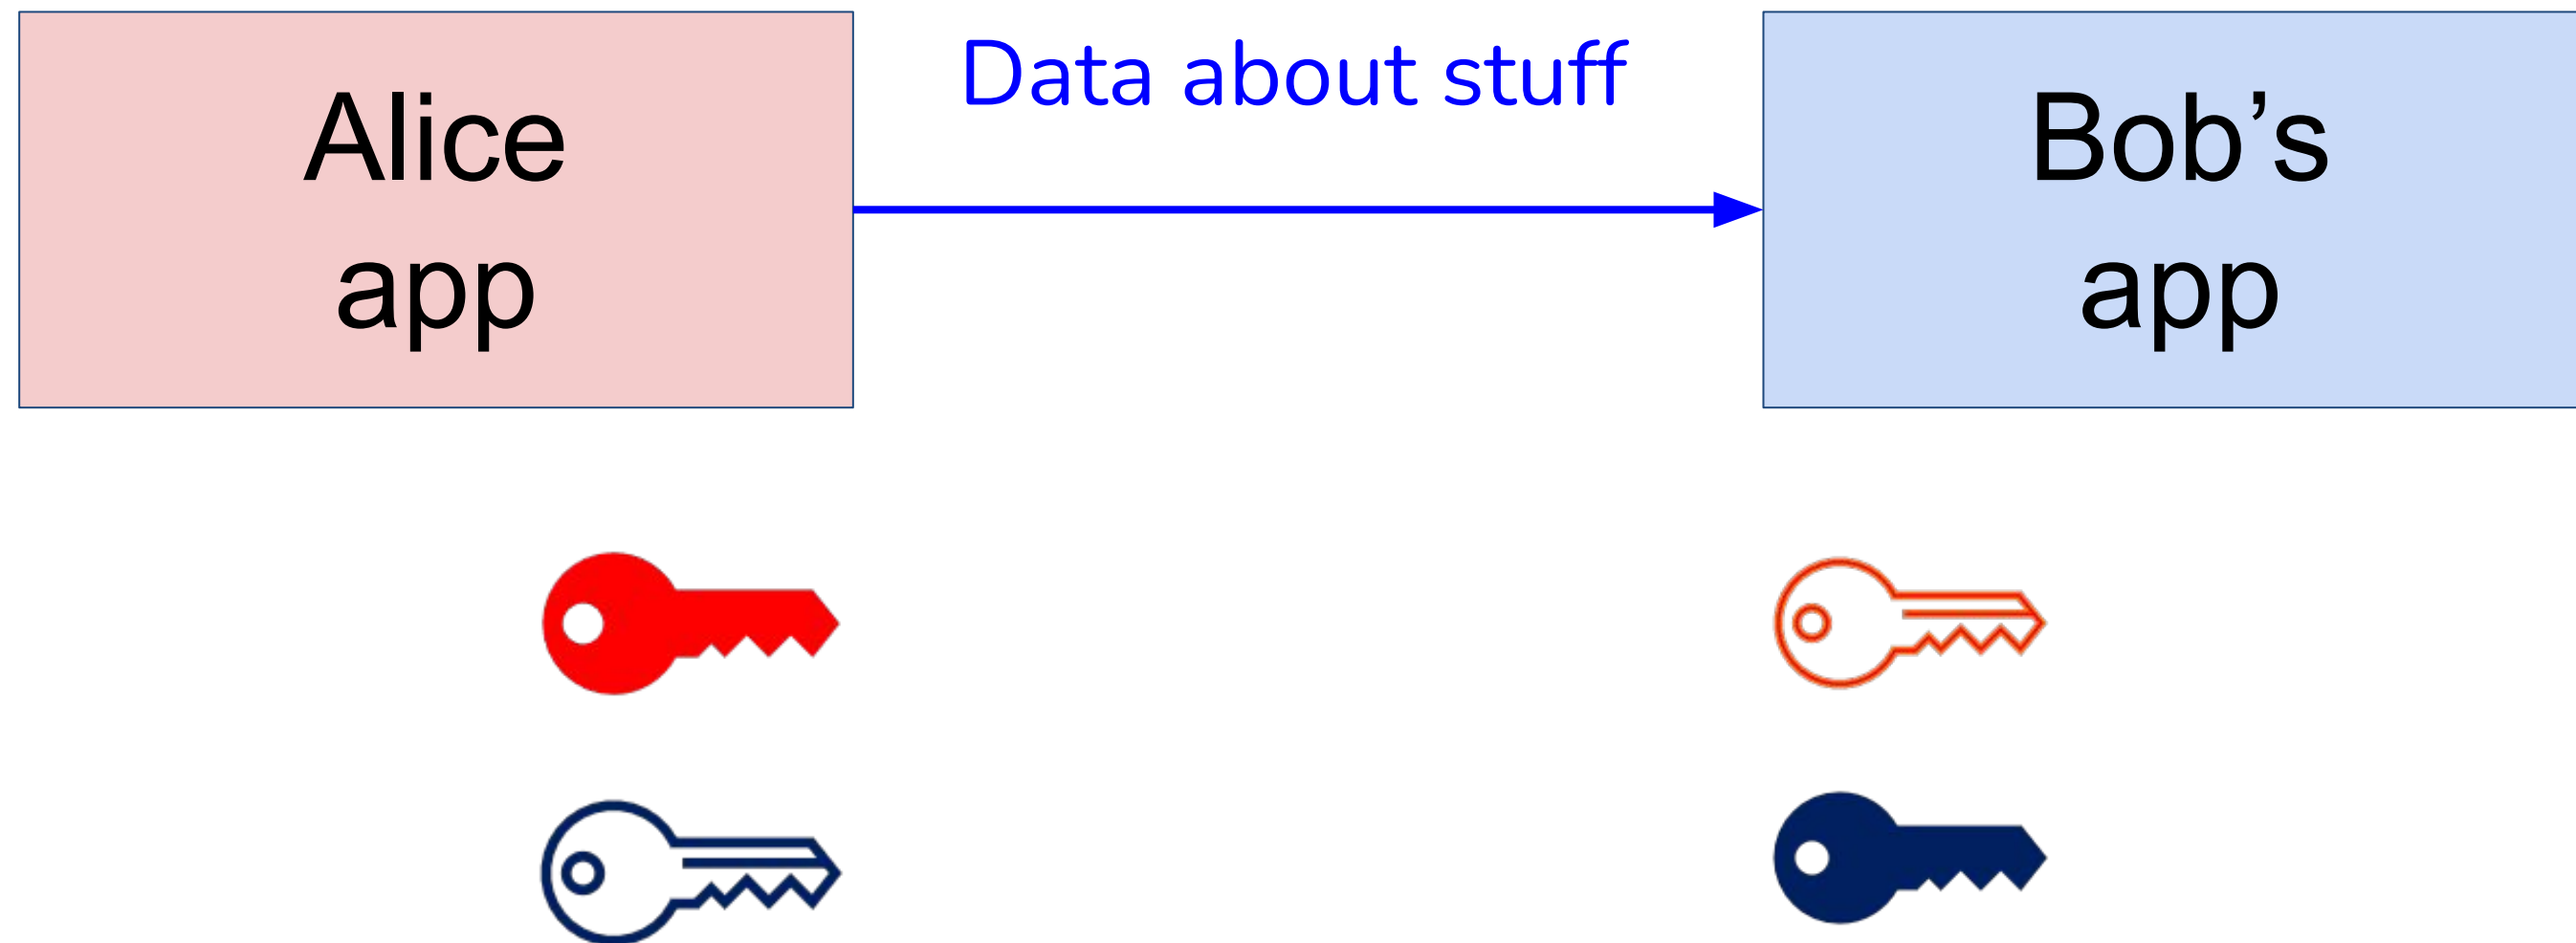

- True end-to-end encryption
- Personas & Polymorphism
- Shared libraries & data

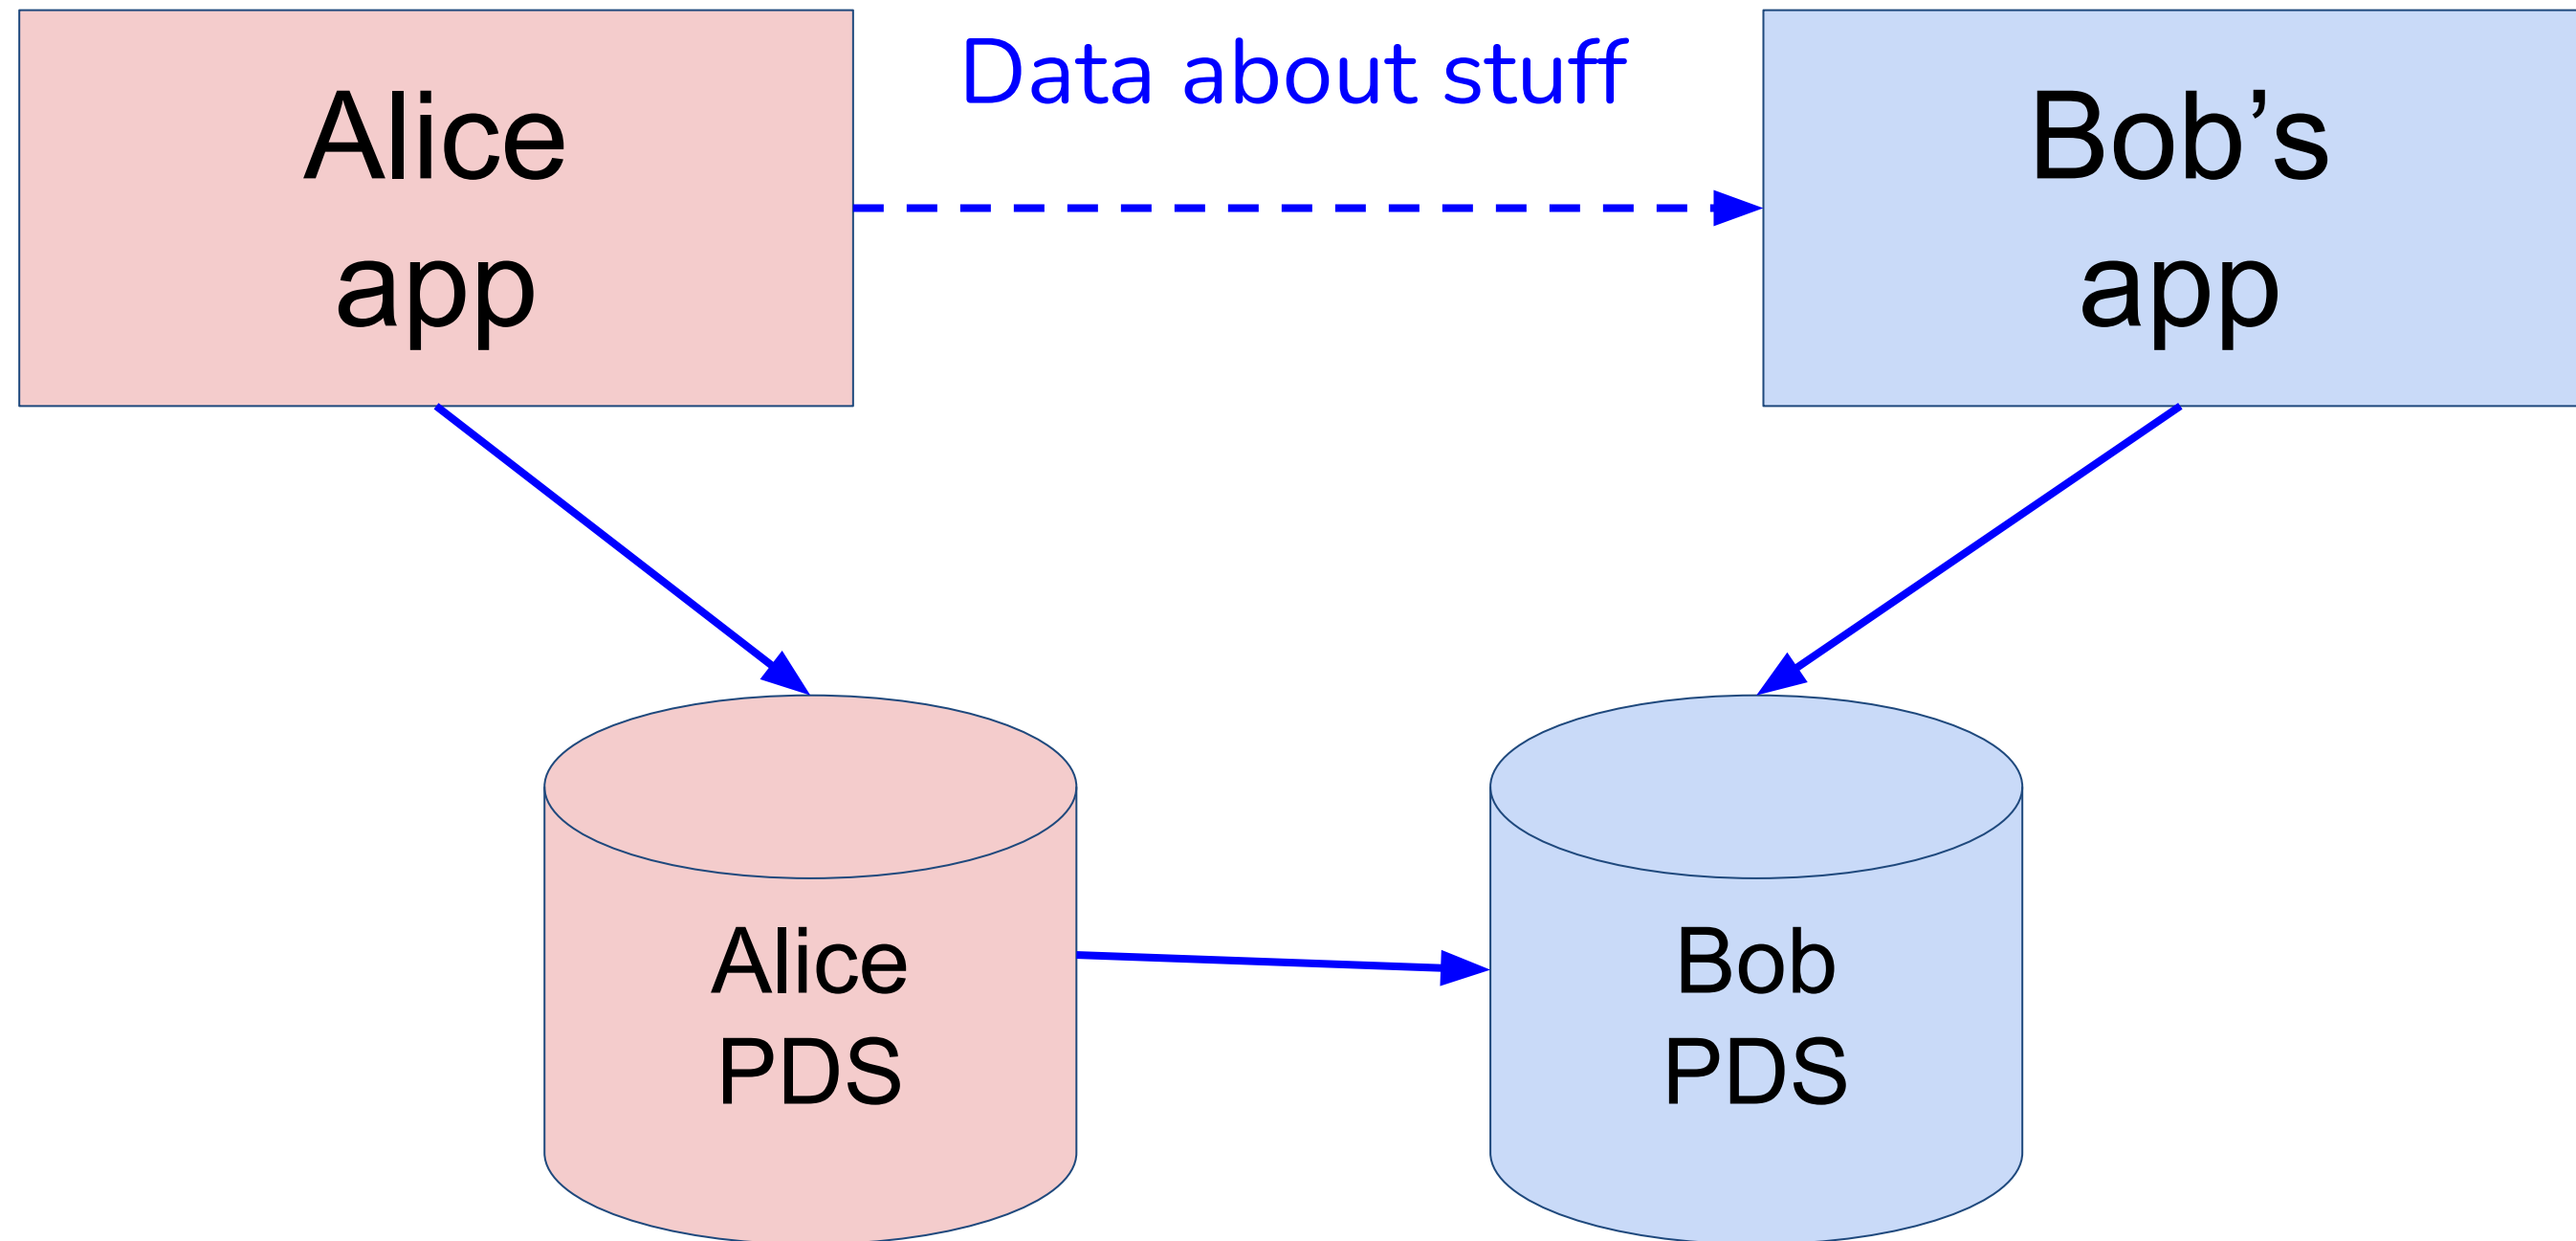

Alice and Bob each have public and private keys

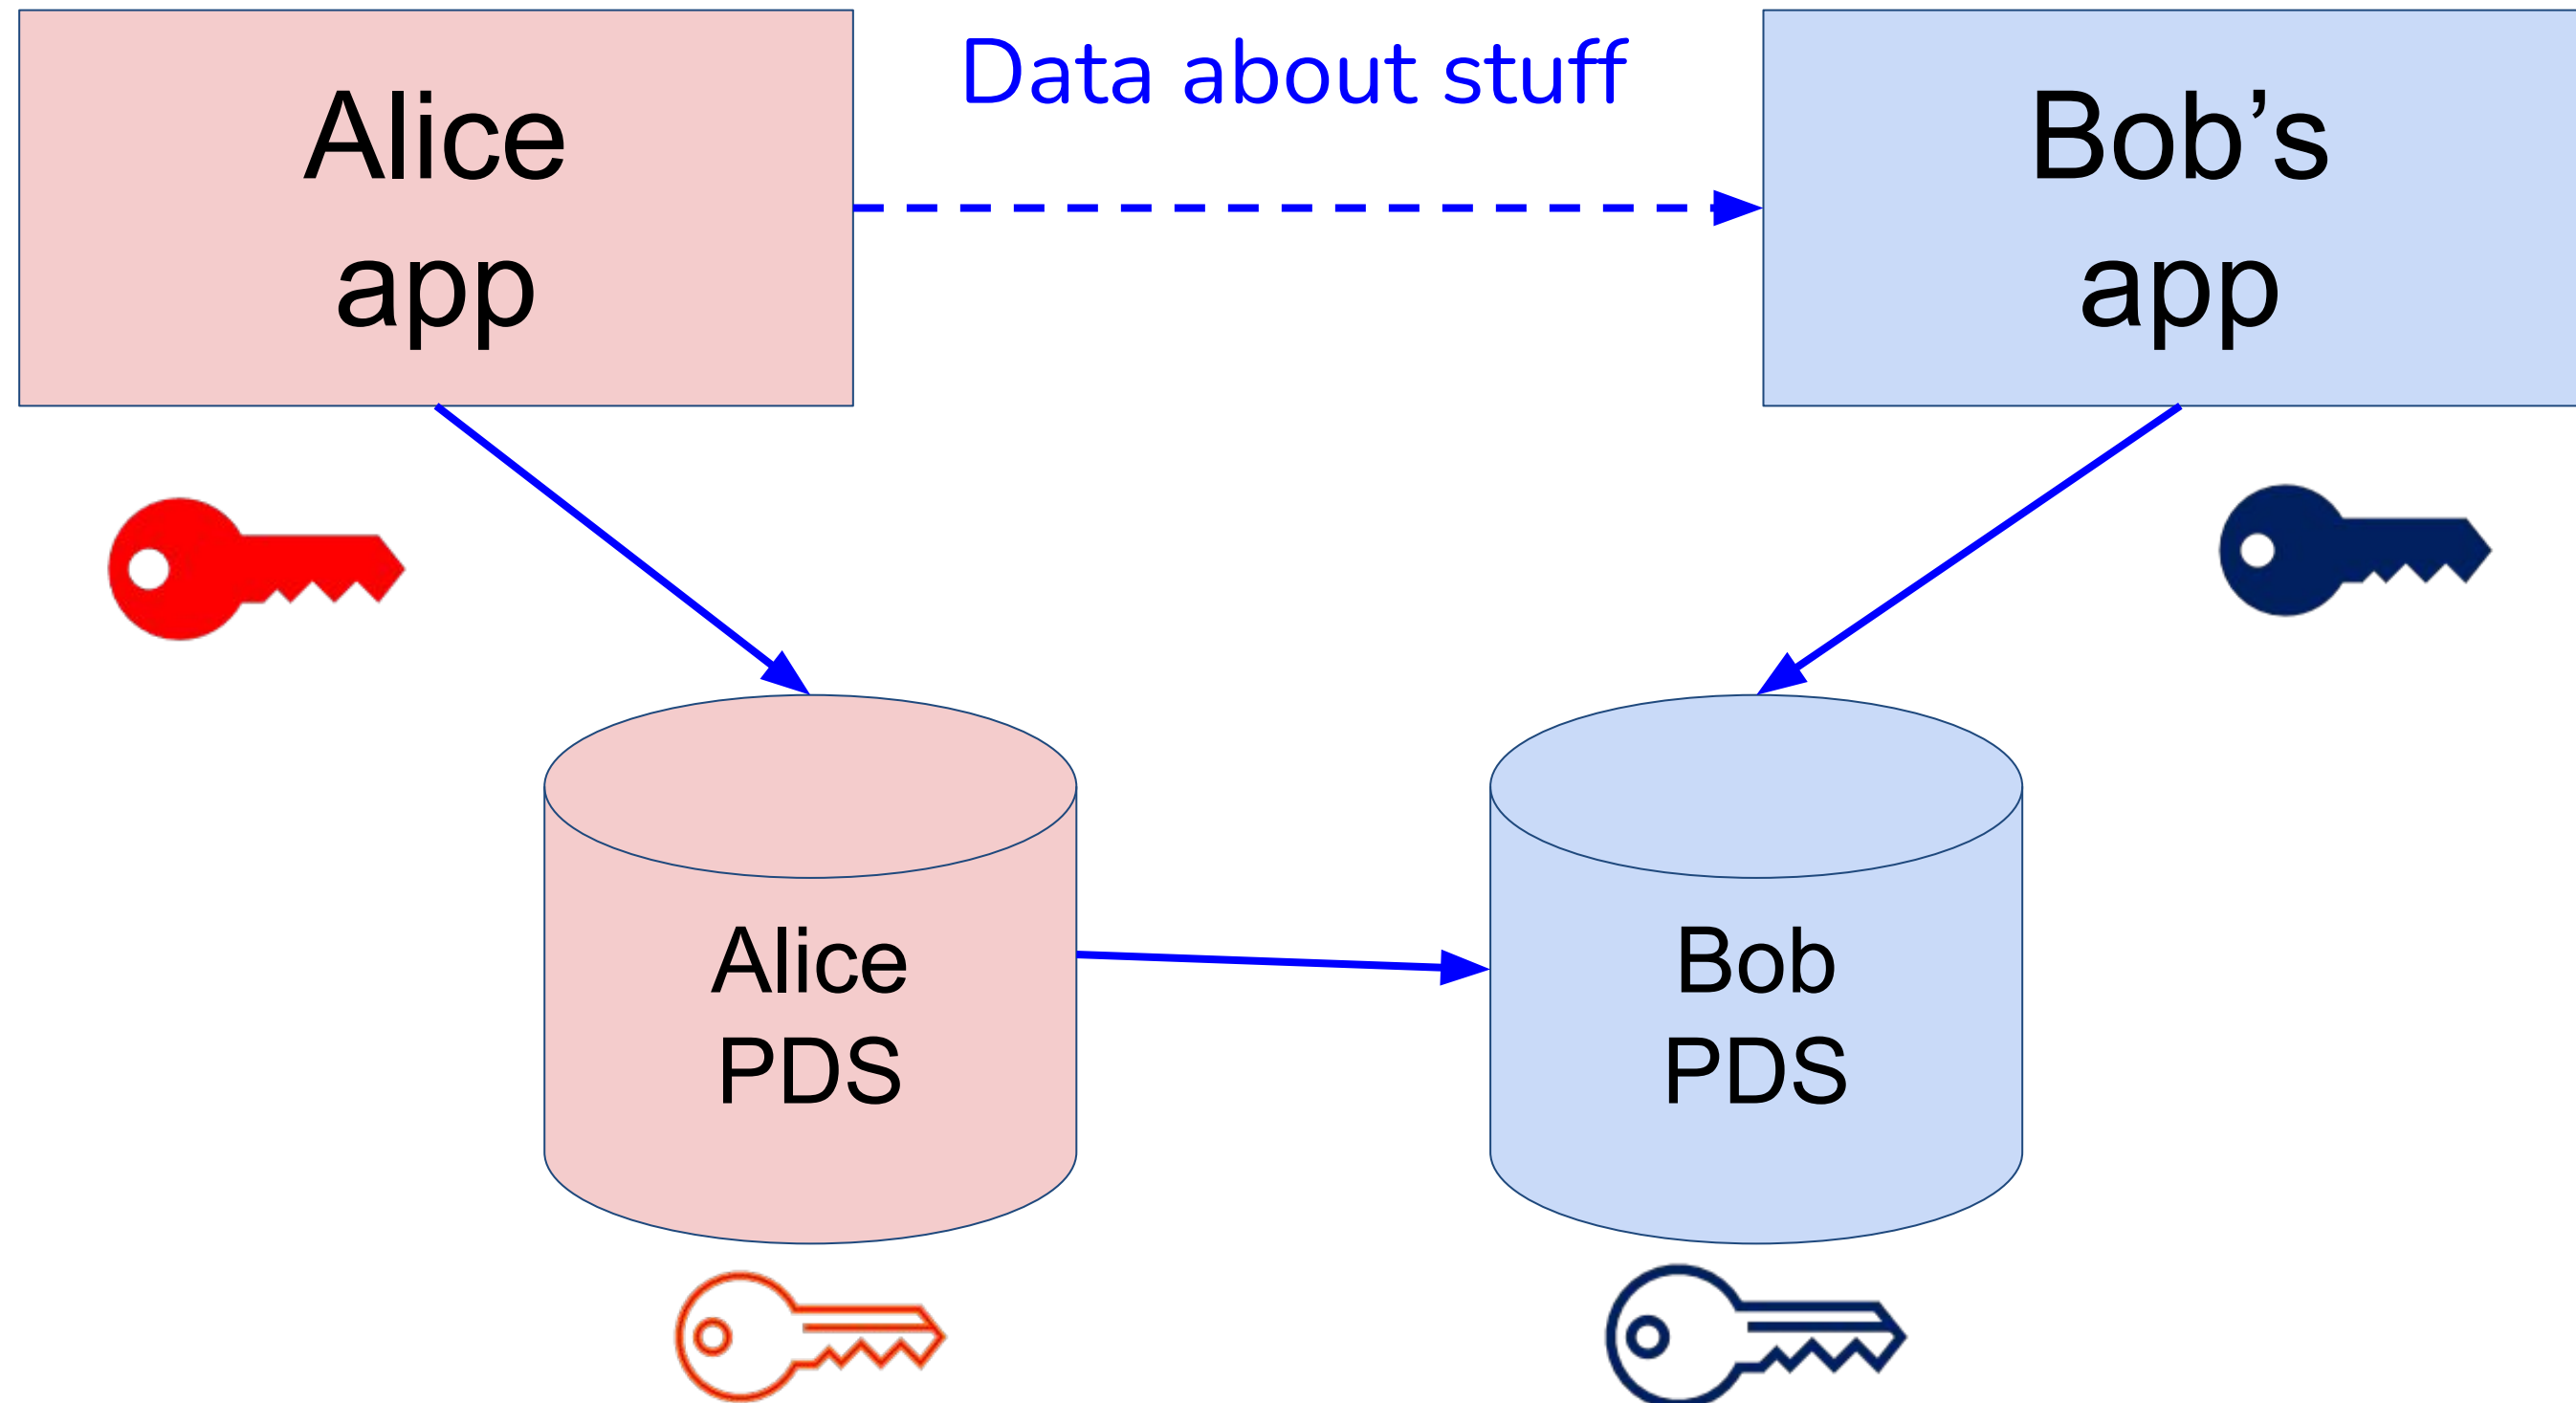

Public keys need to be exchanged

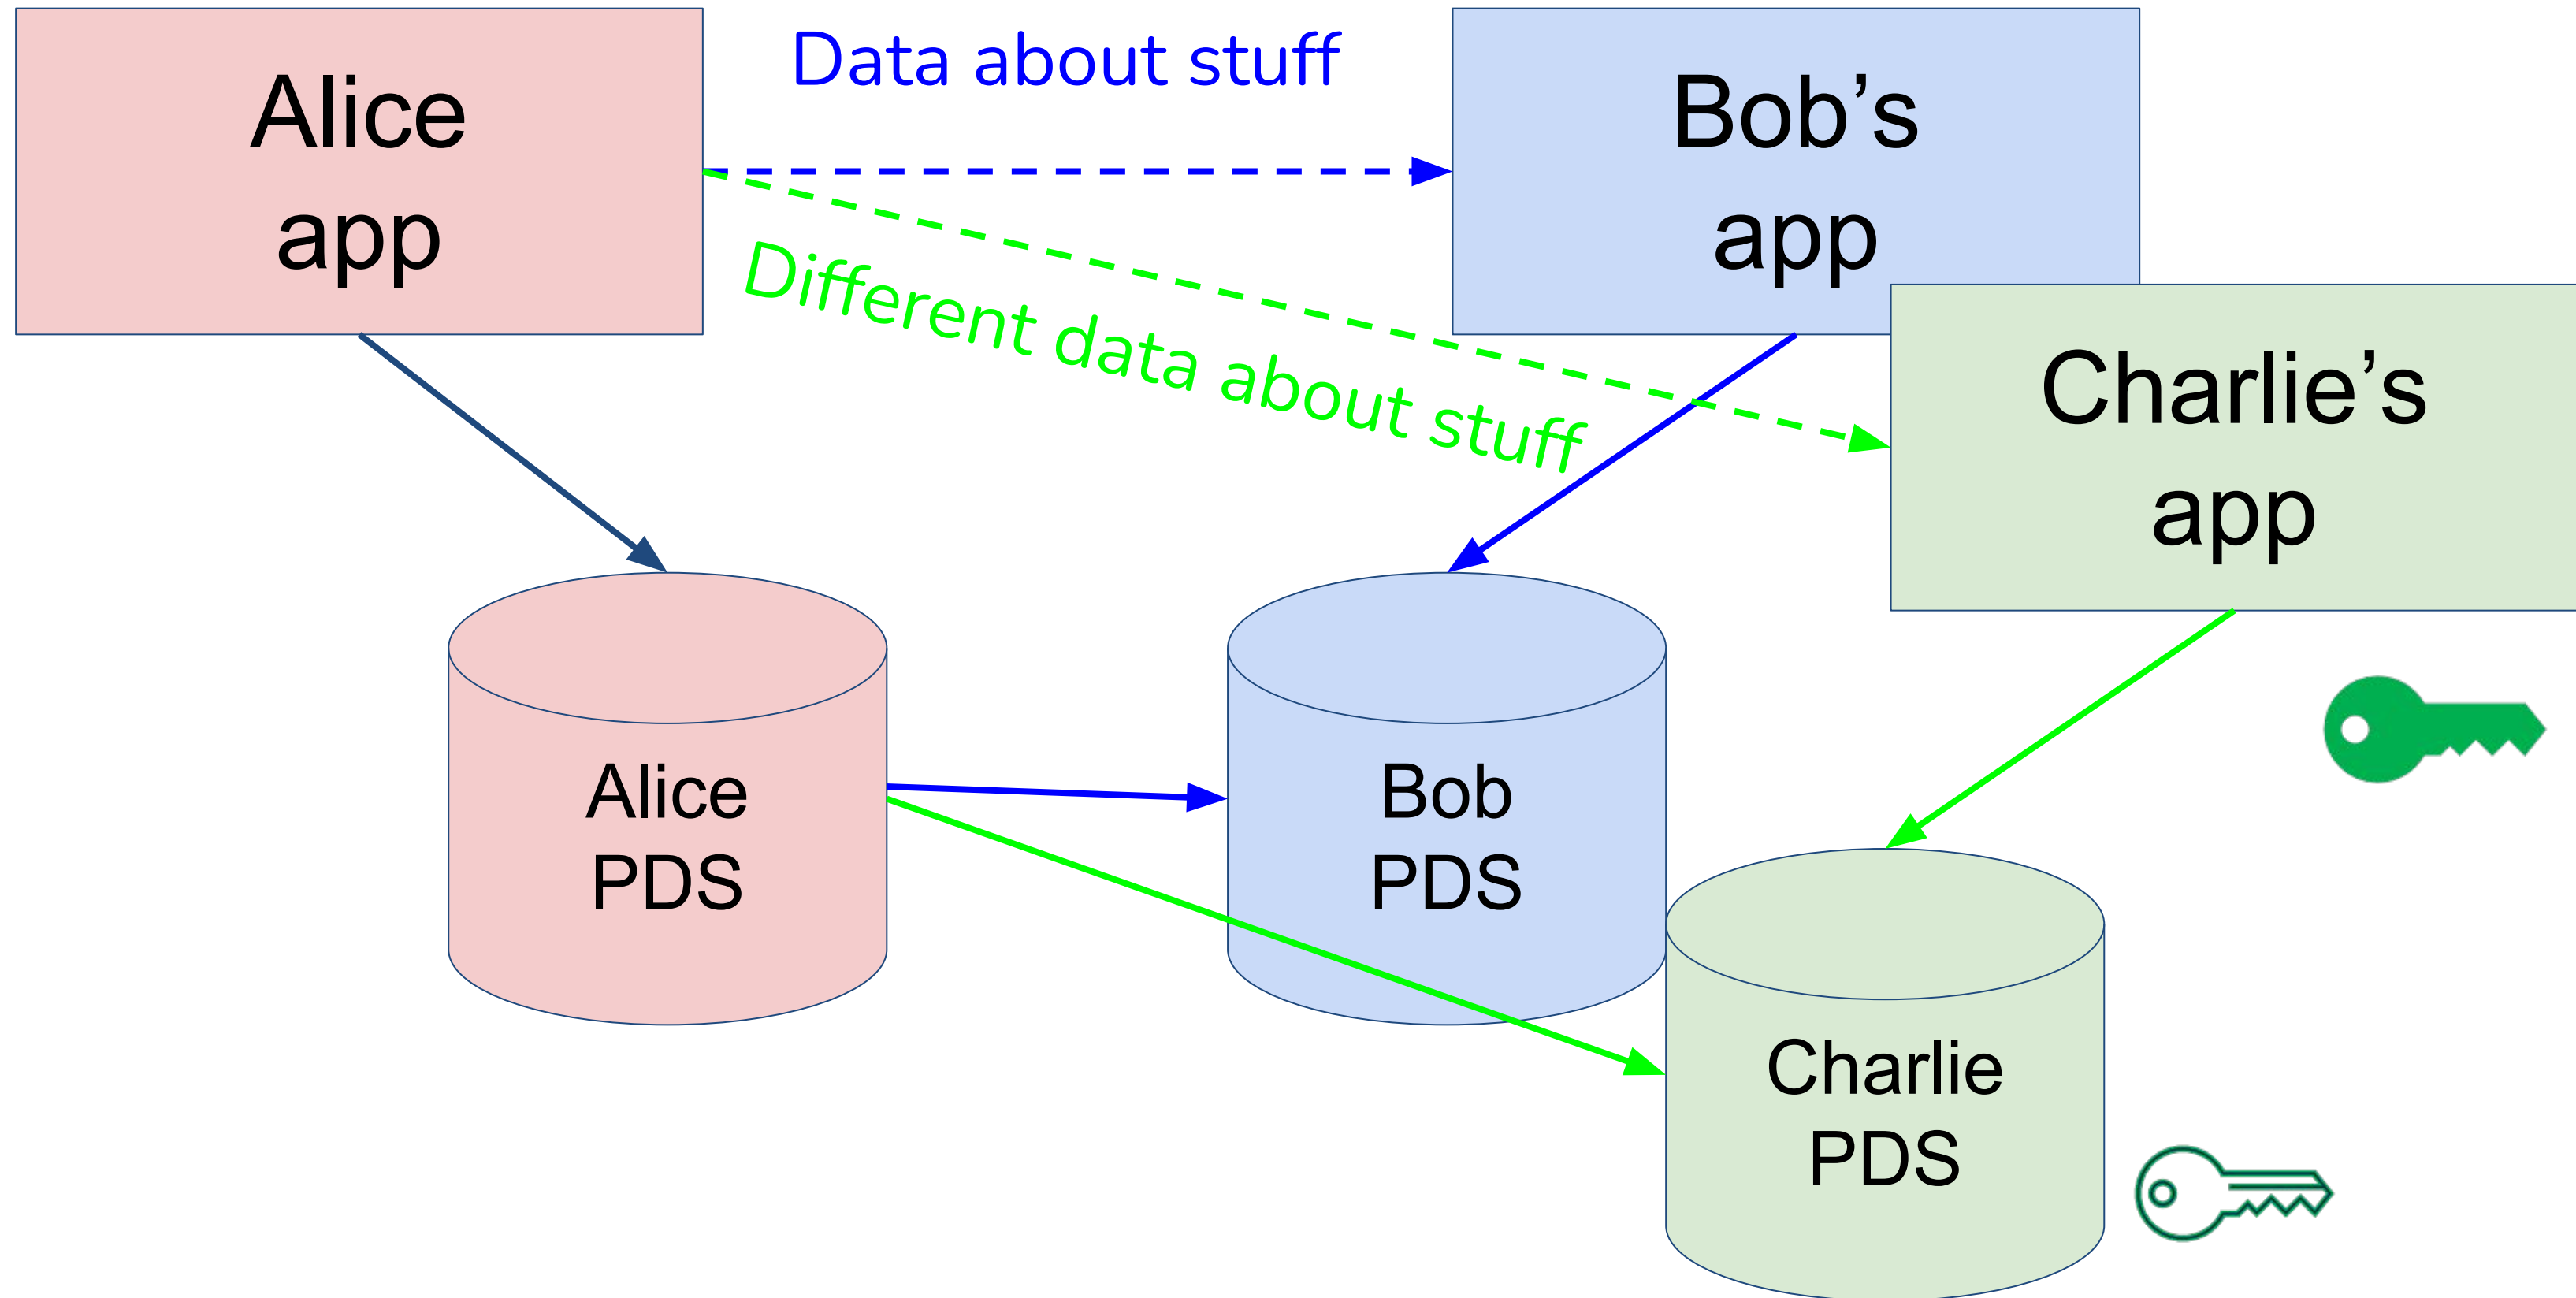

Introduce personal data stores

This helps us manage key exchange

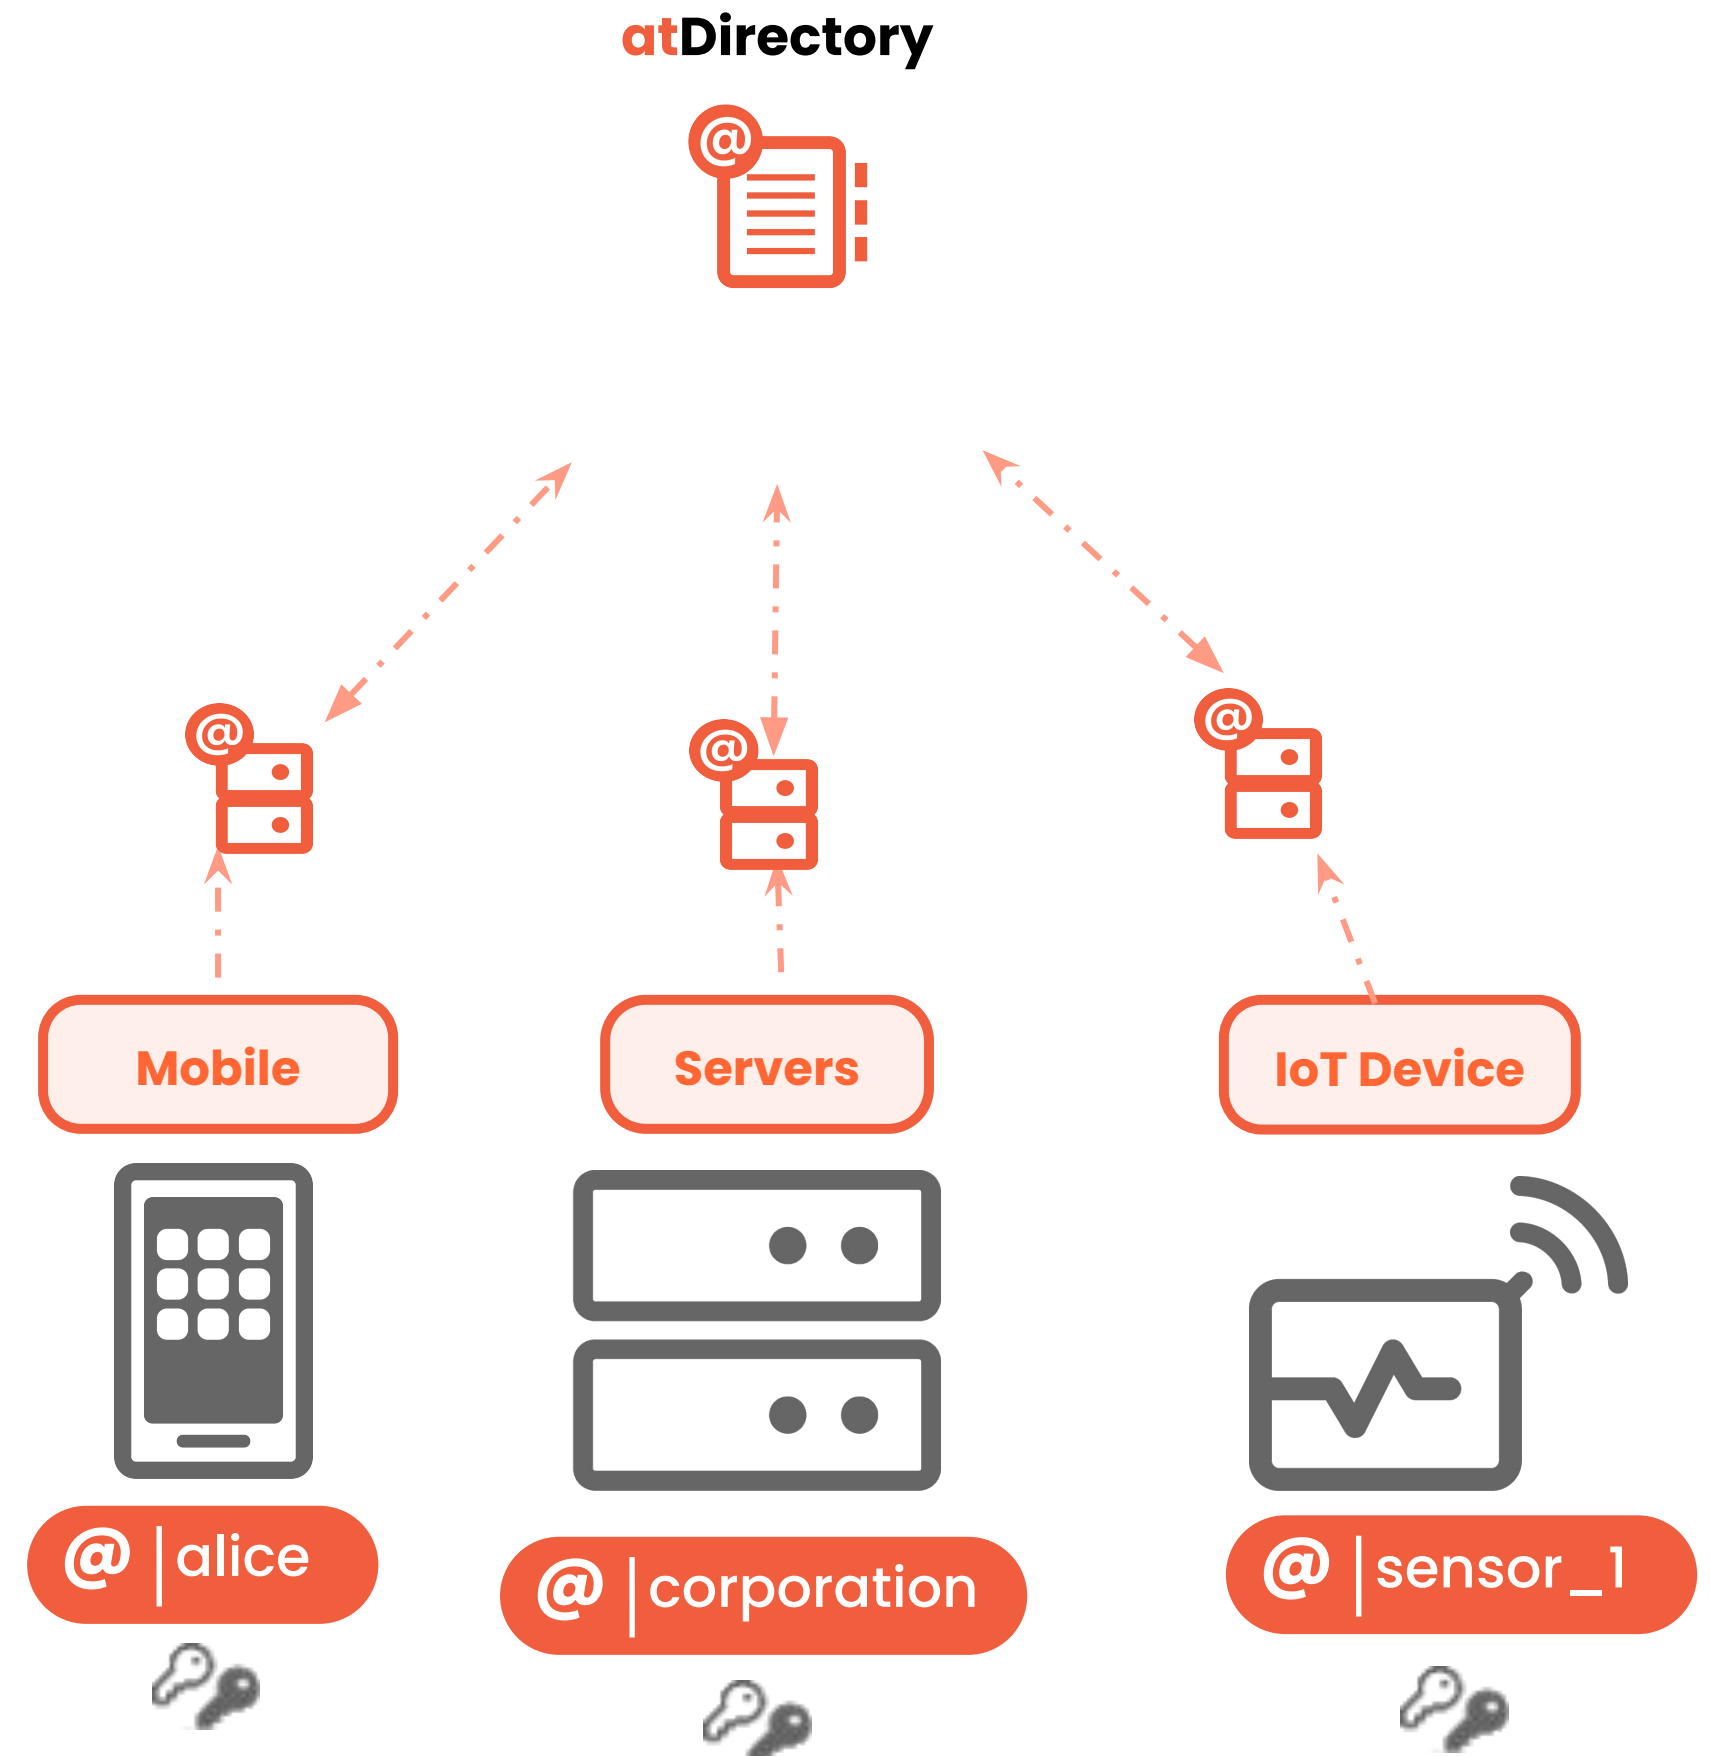

Share different data with different people

Atsigns

Safer & Simpler

- End-to-end encryption
(keys at the edge)
- Fully decentralized
- Devices can cut their own keys

2033 – 100 Billion Atsigns

Company Highlights

- Award Winning Technology
- 1 patent – **5 claims** accepted
33 more patent claims pending
- **Successfully** pen tested
- **Open source**
- **Next generation security**

Article

Written By Xose Perez, Rakwireless

“ After all this complexity, there's good news: there is indeed a secure, remote, and straightforward way to achieve this!

Atsign is a globally distributed company offering networking tools. One of its projects is SSH No Ports, a connectivity solution with some unique features:

- A directory server (atDirectory) replaces ever-changing IPs with simple, unique device names known as atSigns.
- The tunnels are only active as needed, with the device primarily waiting for a request that the directory server has previously validated.
- A rendezvous point (Socket Rendezvous or SR) opens two single-use sockets, creating isolated secure tunnels from the client to the device.
- Two initial tunnels connect both machines to the rendezvous server upon request. The keys used for these tunnels are single-use and generated on-the-fly.

This entire process adheres to a Zero Trust Policy, securing your data end-to-end with keys stored only on your device and your client.”
