

Getting data in and out of the cloud

24th September 2009

What where we doing?

How did we do it?

How could this be done better?

The long way round

IMAP client

This is of course a trivial example but,
Why did it work?

Standardised interface

¥ IMAP

- Both services supported this interface, as did the client application
- The interface was bidirectional

Standardised data format

¥ email

- Both services could parse the same data

If we were dealing with something less trivial
Why wouldn't it work?

Capital SCF

Lack of standardised interfaces

Lack of standardised data format

⇒ ETL(aaS) becomes a big deal

- to cope with impedance mismatches

ButÉ beware bitrot on Transformation.

- Target schemas may not support full range of import data set

Thank you for listening
